Read OWNER’S MANUAL before operating.
Foreword

This manual is designed primarily for use by trained mechanics in a properly equipped shop. However, it contains enough detail and basic information to make it useful to the owner who desires to perform his own basic maintenance and repair work. A basic knowledge of mechanics, the proper use of tools, and workshop procedures must be understood in order to carry out maintenance and repair satisfactorily. Whenever the owner has insufficient experience or doubts his ability to do the work, all adjustments, maintenance, and repair should be carried out only by qualified mechanics.

In order to perform the work efficiently and to avoid costly mistakes, read the text, thoroughly familiarize yourself with the procedures before starting work, and then do the work carefully in a clean area. Whenever special tools or equipment are specified, do not use makeshift tools or equipment. Precision measurements can only be made if the proper instruments are used, and the use of substitute tools may adversely affect safe operation.

For the duration of the warranty period, we recommend that all repairs and scheduled maintenance be performed in accordance with this service manual. Any owner maintenance or repair procedure not performed in accordance with this manual may void the warranty.

To get the longest life out of your vehicle:

- Be alert for problems and non-scheduled maintenance.
- Use proper tools and genuine Kawasaki Motorcycle parts. Special tools, gauges, and testers that are necessary when servicing Kawasaki motorcycles are introduced by the Service Manual. Genuine parts provided as spare parts are listed in the Parts Catalog.
- Follow the procedures in this manual carefully. Don’t take shortcuts.
- Remember to keep complete records of maintenance and repair with dates and any new parts installed.

How to Use This Manual

In preparing this manual, we divided the product into its major systems. These systems became the manual’s chapters. All information for a particular system from adjustment through disassembly and inspection is located in a single chapter.

The Quick Reference Guide shows you all of the product’s system and assists in locating their chapters. Each chapter in turn has its own comprehensive Table of Contents.

The Periodic Maintenance Chart is located in the Periodic Maintenance chapter. The chart gives a time schedule for required maintenance operations.

If you want spark plug information, for example, go to the Periodic Maintenance Chart first. The chart tells you how frequently to clean and gap the plug. Next, use the Quick Reference Guide to locate the Periodic Maintenance chapter. Then, use the Table of Contents on the first page of the chapter to find the Spark Plug section.

Whenever you see these WARNING and CAUTION symbols, heed their instructions! Always follow safe operating and maintenance practices.

**WARNING**

This warning symbol identifies special instructions or procedures which, if not correctly followed, could result in personal injury, or loss of life.

**CAUTION**

This caution symbol identifies special instructions or procedures which, if not strictly observed, could result in damage to or destruction of equipment.

This manual contains four more symbols (in addition to WARNING and CAUTION) which will help you distinguish different types of information.
NOTE
○ This note symbol indicates points of particular interest for more efficient and convenient operation.
• Indicates a procedural step or work to be done.
○ Indicates a procedural sub-step or how to do the work of the procedural step it follows. It also precedes the text of a NOTE.
★ Indicates a conditional step or what action to take based on the results of the test or inspection in the procedural step or sub-step it follows.
In most chapters an exploded view illustration of the system components follows the Table of Contents. In these illustrations you will find the instructions indicating which parts require specified tightening torque, oil, grease or a locking agent during assembly.

1-2 GENERAL INFORMATION

Before Servicing

Before starting to perform an inspection service or carry out a disassembly and reassembly operation on a motorcycle, read the precautions given below. To facilitate actual operations, notes, illustrations, photographs, cautions, and detailed descriptions have been included in each chapter wherever necessary. This section explains the items that require particular attention during the removal and reinstallation or disassembly and reassembly of general parts.

Especially note the following:

**Battery Ground**

Before completing any service on the motorcycle, disconnect the battery wires from the battery to prevent the engine from accidentally turning over. Disconnect the ground wire (−) first and then the positive (+). When completed with the service, first connect the positive (+) wire to the positive (+) terminal of the battery then the negative (−) wire to the negative terminal.

**Edges of Parts**

Lift large or heavy parts wearing gloves to prevent injury from possible sharp edges on the parts.

**Solvent**

Use a high-flush point solvent when cleaning parts. High-flush point solvent should be used according to directions of the solvent manufacturer.

**Cleaning Vehicle before Disassembly**

Clean the vehicle thoroughly before disassembly. Dirt or other foreign materials entering into sealed areas during vehicle disassembly can cause excessive wear and decrease performance of the vehicle.
Before Servicing

Arrangement and Cleaning of Removed Parts
Disassembled parts are easy to confuse. Arrange the parts according to the order the parts were disassembled and clean the parts in order prior to assembly.

Storage of Removed Parts
After all the parts including subassembly parts have been cleaned, store the parts in a clean area. Put a clean cloth or plastic sheet over the parts to protect from any foreign materials that may collect before re-assembly.

Inspection
Reuse of worn or damaged parts may lead to serious accident. Visually inspect removed parts for corrosion, discoloration, or other damage. Refer to the appropriate sections of this manual for service limits on individual parts. Replace the parts if any damage has been found or if the part is beyond its service limit.

Replacement Parts
Replacement parts must be KAWASAKI genuine or recommended by KAWASAKI. Gaskets, O-rings, oil seals, grease seals, circlips or cotter pins must be replaced with new ones whenever disassembled.

Assembly Order
In most cases assembly order is the reverse of disassembly, however, if assembly order is provided in this Service Manual, follow the procedures given.
1-4 GENERAL INFORMATION

Before Servicing

**Tightening Sequence**
Generally, when installing a part with several bolts, nuts, or screws, start them all in their holes and tighten them to a snug fit. Then tighten them according to the specified sequence to prevent case warpage or deformation which can lead to malfunction. Conversely when loosening the bolts, nuts, or screws, first loosen all of them by about a quarter turn and then remove them. If the specified tightening sequence is not indicated, tighten the fasteners alternating diagonally.

**Tightening Torque**
Incorrect torque applied to a bolt, nut, or screw may lead to serious damage. Tighten fasteners to the specified torque using a good quality torque wrench. Often, the tightening sequence is followed twice-initial tightening and final tightening with torque wrench.

**Force**
Use common sense during disassembly and assembly, excessive force can cause expensive or hard to repair damage. When necessary, remove screws that have a non-permanent locking agent applied using an impact driver. Use a plastic-faced mallet whenever tapping is necessary.

**Gasket, O-ring**
Hardening, shrinkage, or damage of both gaskets and O-rings after disassembly can reduce sealing performance. Remove old gaskets and clean the sealing surfaces thoroughly so that no gasket material or other material remains. Install new gaskets and replace used O-rings when re-assembling.

**Liquid Gasket, Non-permanent Locking Agent**
For applications that require Liquid Gasket or a Non-permanent Locking Agent, clean the surfaces so that no oil residue remains before applying liquid gasket or non-permanent locking agent. Do not apply them excessively. Excessive application can clog oil passages and cause serious damage.
Before Servicing

Press

For items such as bearings or oil seals that must be pressed into place, apply small amount of oil to the contact area. Be sure to maintain proper alignment and use smooth movements when installing.

Ball Bearing and Needle Bearing

Do not remove pressed ball or needle unless removal is absolutely necessary. Replace with new ones whenever removed. Press bearings with the manufacturer and size marks facing out. Press the bearing into place by putting pressure on the correct bearing race as shown.

Pressing the incorrect race can cause pressure between the inner and outer race and result in bearing damage.

Oil Seal, Grease Seal

Do not remove pressed oil or grease seals unless removal is necessary. Replace with new ones whenever removed. Press new oil seals with manufacture and size marks facing out. Make sure the seal is aligned properly when installing.

Apply specified grease to the lip of seal before installing the seal.

Circlips, Cotter Pins

Replace circlips or cotter pins that were removed with new ones. Take care not to open the clip excessively when installing to prevent deformation.
1-6 GENERAL INFORMATION

Before Servicing

Lubrication
It is important to lubricate rotating or sliding parts during assembly to minimize wear during initial operation. Lubrication points are called out throughout this manual, apply the specific oil or grease as specified.

Direction of Engine Rotation
When rotating the crankshaft by hand, the free play amount of rotating direction will affect the adjustment. Rotate the crankshaft to positive direction (clockwise viewed from output side).

Electrical Wires
A two-color wire is identified first by the primary color and then the stripe color. Unless instructed otherwise, electrical wires must be connected to those of the same color.

Instrument
Use a meter that has enough accuracy for an accurate measurement. Read the manufacture’s instructions thoroughly before using the meter. Incorrect values may lead to improper adjustments.

Cassette Type Transmission

The transmission of the current model is unable to be removed without disassembling upper and lower crankcase halves.

The ER650A enables transmission to be removed from the right side of engine as an assy, without disassembling crankcase halves (see Transmission Assy Removal in the Crankshaft/Transmission chapter).

Transmission Assy:
- Drive Shaft [A]
- Output Shaft [B]
- Shift Rods [C]
- Shift Dram [D]
- Shift Forks [E]
- Transmission Case [F]
Atmospheric pressure sensor and camshaft position sensor are not equipped with the ER650A. As a substitute of these sensors above, the ER650A recognizes atmospheric pressure and intake stroke of #1 by the signal of inlet air pressure sensor.

The ECU detects atmospheric pressure when the ignition is switched ON. While the engine is running, the ECU also presumes atmospheric pressure by analyzing the waveform of boost pressure over fixed period. The intake stroke is recognized by waveform of boost pressure, therefore the system can recognize the difference of each stroke.

#### Torque and Locking Agent

The following tables list the tightening torque for the major fasteners requiring use of a non-permanent locking agent or liquid gasket.

Letters used in the "Remarks" column mean:
- **AL**: Tighten the two clamp bolts alternately two times to ensure even tightening torque.
- **EO**: Apply engine oil.
- **L**: Apply a non-permanent locking agent to the threads.
- **Lh**: Left-hand threads
- **MO**: Apply molybdenum disulfide oil solution.
- **R**: Replacement Parts
- **S**: Tighten the fasteners following the specified sequence.
- **Si**: Apply silicone grease (ex. PBC grease).
- **SS**: Apply silicone sealant.

**Periodic Maintenance Procedures**

### Fuel System (DFI)
*Fuel Hose Inspection (fuel leak, damage, installation condition)*
- The fuel hose is designed to be used throughout the motorcycle’s life without any maintenance. However, if the motorcycle is not properly handled, the high pressure inside the fuel line can cause fuel to leak [A] or the hose to burst. Remove the fuel tank (see Fuel Tank Removal Fuel System (DFI) chapter) and check the fuel hose.
  - Replace the fuel hose if any fraying, cracks [B] or bulges [C] are noticed.

- Check that the hoses are routed according to Cable, Wire, and Hose Routing section in the Appendix chapter.
  - Replace the hose if it has been sharply bent or kinked.

**Hose Joints (A)**

**Fuel Hose (B)**

- Check that the hose joints are securely connected.
  - Push and pull [A] the hose joint [B] back and forth more than two times, and make sure it is locked.
  - If it does not locked, reinstall the hose joint.

**WARNING**

> Make sure the hose joint is installed correctly on the delivery pipe by sliding the joint, or the fuel could leak.

**Throttle Control System Inspection**

- Check that the throttle grip moves smoothly from full open to close [A], and the throttle closes quickly and completely by the return spring in all steering positions.
  - If the throttle grip doesn’t return properly, check the throttle cable routing, grip free play, and cable damage. Then lubricate the throttle cable.

- Check the throttle grip free play [A].
  - If the free play is incorrect, adjust the throttle cable.

**Throttle Grip Free Play**

*Standard:* 2 ~ 3 mm (0.08 ~ 0.12 in.)
Periodic Maintenance Procedures

If necessary, adjust the throttle cable as follows.

- Loosen the locknut [A] at the upper end of the accelerator cable.
- Turn the adjuster [B] in completely so as to give the throttle grip plenty of play.

- Loosen the locknut [A] at the middle of the decelerator cable.
- Turn the adjuster [B] until there is no play when the throttle grip is completely closed.
- Tighten the locknut.
- Turn the accelerator cable adjuster until the proper amount of throttle grip free play is obtained.
- Tighten the locknut.

Idle Speed Inspection

- Start the engine and warm it up thoroughly.
- With the engine idling, turn the handlebar to both sides [A].
- If handlebar movement changes the idle speed, the throttle cables may be improperly adjusted or incorrectly routed or damaged. Be sure to correct any of these conditions before riding (see Throttle Control System Inspection or Cable, Wire, and Hose Routing section in the Appendix chapter).

**WARNING**

Operation with improperly adjusted, incorrectly routed or damaged cables could result in an unsafe riding condition.

- Check idle speed.
- If the idle speed is out of the specified range, adjust it.

**Idle Speed**

- Standard: 1,300 ±50 r/min (rpm)

**Idle Speed Adjustment**

- Start the engine and warm it up thoroughly.
- Turn the adjusting screw [A] until the idle speed is correct.
- Open and close the throttle a few times to make sure that the idle speed is within the specified range. Readjust if necessary.
2-16 PERIODIC MAINTENANCE

Periodic Maintenance Procedures

Air Cleaner Element Cleaning

**NOTE**

○ In dusty areas, the element should be cleaned more frequently than the recommended interval.
○ After riding through rain or on muddy roads, the element should be cleaned immediately.

</tr>

<tr>
<td>If dirt gets through into the engine, excessive engine wear and possibly engine damage will occur.</td>

</tbody>

- Remove the fuel tank (see Fuel Tank Removal in the Fuel System (DFI) chapter).
- Remove:
  - Air Switching Valve Hose [A] (Disconnect)
  - Air Cleaner Element Screw [B]
  - Air Cleaner Element [C]

- Remove:
  - Upper Plastic Holder [A]
  - Element [B]

**NOTE**

○ The wire screen [A] is fastened with an adhesive for the shaded portion [B]. Do not remove the wire screen.
### Periodic Maintenance Procedures

**A WARNING**

Clean the element in a well-ventilated area, and make sure that there are no sparks or flame anywhere near the working area. Because of the danger of highly flammable liquids, do not use gasoline or a low flash-point solvent to clean the element.

- Clean the element [A] in a bath of high flash-point solvent, and then dry it with compressed air or by shaking it.
- After cleaning, saturate a clean, lint-free towel with SE, SF, or SG class SAE 30 oil and apply the oil to the element by tapping the element outside with the towel.
- Visually check the element for tears or breaks.
- If the element has any tears or breaks, replace the element.

- Install the element unit [A] with the foam element side (gray) [B] facing down.

### Engine Vacuum Synchronization Inspection

**NOTE**

- These procedures are explained on the assumption that the inlet and exhaust systems of the engine are in good condition.

- Situate the motorcycle so that it is vertical.
- Remove the center fairing (see Center Fairing Removal in the Frame chapter).
- Pull off the rubber caps [A] from the fitting of each throttle body (In the photo, the throttle body has been removed for clarity).

**CAUTION**

- Do not remove the inlet air pressure sensor hose [B] on the left fitting of the throttle body.

- Connect a commercially available vacuum gauge and hoses [A] to the fittings of the throttle body as shown.
- Connect a highly accurate tachometer to one of the stick coil primary leads.
2-18 PERIODIC MAINTENANCE

Periodic Maintenance Procedures

- Start the engine and warm it up thoroughly.
- Check the idle speed.
  - Tachometer [A]
- Open and close the throttle.
- If the idle speed is out of the specified range, adjust it.

**CAUTION**

Do not measure the idle speed by the tachometer of the meter unit.

- While idling the engine, inspect the engine vacuum, using the vacuum gauge [B].

**Engine Vacuum**

- Standard: 35.3 ±1.3 kPa (265 ±10 mmHg) at Idle Speed 1 300 ±50 r/min (rpm)

- If any one vacuum is not within the specification, turn in the bypass screws until it seats fully but not tightly.

Special Tool - Pilot Screw Adjuster, E [A]: 57001-1603

**CAUTION**

Do not over tighten them. They could be damaged, requiring replacement.

- Turn out the bypass screw of the higher vacuum between #1 [A] and #2 [B] to the lower vacuum.
- Open and close the throttle valves after each measurement and adjust the idle speed as necessary.
- Inspect the vacuums as before.
  - If both vacuums are within the specification, finish the engine vacuum synchronization.
- If any vacuum can not be adjusted within the specification, remove the bypass screws #1, #2 and clean them.

- Remove the bypass screw [A], spring [B], washer [C] and O-ring [D].
  - Check the bypass screw and its hole for carbon deposits.
  - If any carbon accumulates, wipe the carbon off the bypass screw and the hole, using a cotton pad penetrated with a high-flash point solvent.
  - Replace the O-ring with a new one.
  - Check the tapered portion [E] of the bypass screw for wear or damage.
  - If the bypass screw is worn or damaged, replace it.
  - Turn in the bypass screw until it seats fully but not tightly.
Periodic Maintenance Procedures

- Repeat the same procedure for other bypass screws.
- Repeat the synchronization.

★ If the vacuums are correct, check the output voltage of the main throttle sensor (see Main Throttle Sensor Output Voltage Inspection in the Fuel System (DFI) chapter).

Main Throttle Sensor Output Voltage
Connections to ECU
  Meter (+) → Y/W lead (terminal 7)
  Meter (−) → BR/BK lead (terminal 28)
Standard:
  1.055 – 1.095 V DC (at idle throttle opening)

★ If the output voltage is out of the range, check the throttle input voltage (see Main Throttle Sensor Input Voltage Inspection in the Fuel System (DFI) chapter).

- Remove the vacuum gauge hoses and install the vacuum hoses and rubber caps.

Cooling System
Coolant Level Inspection

NOTE
  ○ Check the level when the engine is cold (room or ambient temperature).

- Check the coolant level in the reserve tank [A] with the motorcycle held perpendicular (Do not use the sidestand).
  ★ If the coolant level is lower than the "L" line [B], remove the right center fairing (see Center Fairing Removal in the Frame chapter) and unscrew the reserve tank cap, and add coolant to the "F" level line [C].
  "L": low
  "F": full

CAUTION
For refilling, add the specified mixture of coolant and soft water. Adding water alone dilutes the coolant and degrades its anticorrosion properties. The diluted coolant can attack the aluminum engine parts. In an emergency, soft water alone can be added. But the diluted coolant must be returned to the correct mixture ratio within a few days.
If coolant must be added often or the reservoir tank has run completely dry, there is probably leakage in the cooling system. Check the system for leaks. Coolant ruins painted surfaces. Immediately wash away any coolant that spills on the frame, engine, wheels or other painted parts.
2-20 PERIODIC MAINTENANCE

Periodic Maintenance Procedures

Radiator Hose and Pipe Inspection (coolant leak, damage, installation condition)
- The high pressure inside the radiator hose and pipe can cause coolant to leak [A] or the hose to burst if the line is not properly maintained.
- Visually inspect the hoses for signs of deterioration. Squeeze the hoses. A hose should not be hard and brittle, nor should it be soft or swollen.
- Replace the hose if any fraying, cracks [B] or bulges [C] are noticed.
- Check that the hoses are securely connected and clamps are tightened correctly.

**Torque** - Radiator Hose Clamp Screws: 2.0 N·m (0.20 kgf·m, 17 in-lb)

Air Suction System

Air Suction System Damage Inspection
- Remove the fuel tank (see Fuel Tank Removal in the Fuel System (DFI) chapter).
- Remove the fuel hose (see Fuel Hose Replacement).
- Connect:
  - Fuel Pump Lead Connector [A]
  - Extension Tube [B]

Special Tool - Extension Tube: 57001-1578
- Pull the air switching valve hose [C] out of the air cleaner housing.
- Start the engine and run it at idle speed.
- Plug [A] the air switching valve hose end with your finger and feel vacuum pulsing in the hose.
- If there is no vacuum pulsation, check the hose line for leak. If there is no leak, check the air switching valve (see Air Switching Valve Unit Test in the Electrical System chapter) or air suction valve (see Air Suction Valve Inspection in the Engine Top End chapter).

Engine Top End

Valve Clearance Inspection

**NOTE**
- Valve clearance must be checked and adjusted when the engine is cold (room temperature).
- Remove the cylinder head cover (see Cylinder Head Cover Removal in the Engine Top End chapter).
- Unscrew the upper [A] and lower [B] caps on the clutch cover.
Periodic Maintenance Procedures

• Check the valve clearance when the pistons are at TDC.
  ○ The pistons are numbered beginning with the engine left side.
• Using a wrench [A] on the crankshaft rotation bolt, turn the crankshaft clockwise until the "1|T" mark on the timing rotor is aligned with the notch [B] in the edge of the upper hole in the clutch cover for #1 piston and "2|T" mark for #2 piston.

1|T Mark [A]
2|T Mark [B]
Hole [C] of Upper Cap
Notch [D] in Edge of Upper Hole

○ Measure the valve clearance of the valves for which the cam are turned away from each other.

• Using the thickness gauge [A], measure the valve clearance between cam and valve lifter.

Valve Clearance
  Standard:
  Exhaust  0.22 – 0.31 mm (0.0087 – 0.0122 in.)
  Inlet     0.15 – 0.21 mm (0.0059 – 0.0083 in.)

○ Each piston has two inlet and two exhaust valves. Measure these two inlet or exhaust valves at the same crankshaft position.

Valve Clearance Measuring Position
  #1 Piston TDC at End of Compression Stroke →
  Inlet valve clearances of #1 piston, and
  Exhaust valve clearances of #1 piston

NOTE
  ○ Check the valve clearance using this method only. Checking the clearance at any other cam position may result in improper valve clearance.
2-22 PERIODIC MAINTENANCE

Periodic Maintenance Procedures

Valve Clearance Measuring Position
- #2 Piston TDC at End of Compression Stroke →
  - Inlet valve clearances of #2 piston, and
  - Exhaust valve clearances of #2 piston

If the valve clearance is not within the specified range, first record the clearance, and adjust it.

Valve Clearance Adjustment
- To change the valve clearance, remove the camshaft chain tensioner, camshafts and valve lifters. Replace the shim with one of a different thickness.

NOTE
- Mark and record the valve lifter and shim locations so they can be reinstalled in their original positions.
- If there is no clearance, select a shim which is several sizes smaller and then measure the clearance.

- To select a new shim which brings the valve clearance within the specified range, refer to the Valve Clearance Adjustment Charts.
- Apply a thin coat of molybdenum disulfide grease to the valve lifters.
- Install the camshafts. Be sure to time the camshafts properly (see Camshaft Installation in the Engine Top End chapter).
- Remeasure any valve clearance that was adjusted. Readjust if necessary.

CAUTION
- Do not put shim stock under the shim. This may cause the shim to pop out at high rpm, causing extensive engine damage.
- Do not grind the shim. This may cause it to fracture, causing extensive engine damage.
PERIODIC MAINTENANCE 2-23

VALVE CLEARANCE ADJUSTMENT CHART INLET VALVE

1. Measure the clearance (when engine is cold).
2. Check present shim size.
3. Match clearance in vertical column with present shim size in horizontal column.
4. Install the shim specified where the lines intersect. This shim will give the proper clearance.

Example: Present shim is 2.95 mm
        Measured clearance is 0.45 mm
        Replace 2.95 mm shim with 3.20 mm shim.

5. Remeasure the valve clearance and readjust if necessary.
 VALVE CLEARANCE ADJUSTMENT CHART EXHAUST VALVE

1. Measure the clearance (when engine is cold).
2. Check present shim size.
3. Match clearance in vertical column with present shim size in horizontal column.
4. Install the shim specified where the lines intersect. This shim will give the proper clearance.
5. Remeasure the valve clearance and readjust if necessary.

Example: Present shim is 2.95 mm.
Measured clearance is 0.47 mm.
Replace 2.95 mm shim with 3.15 mm shim.
Periodic Maintenance Procedures

Clutch

Clutch Operation Inspection
- Pull the clutch lever just enough to take up the free play [A].
- Measure the gap between the lever and the lever holder.
  ★ If the gap is too wide, the clutch may not release fully. If the gap is too narrow, the clutch may not engage fully. In either case, adjust it.

Clutch Lever Free Play
  Standard: 2 – 3 mm (0.08 – 0.12 in.)

To avoid a serious burn, never touch the engine or exhaust pipe during clutch adjustment.

- Turn the adjuster [A] so that 5 – 6 mm (0.20 – 0.24 in.) [B] of threads are visible.
- Slide the dust cover [A] at the middle of the clutch cable out of place.
- Loosen the locknut [B] at the middle of clutch cable.
- Turn the adjusting nut [C] until the free play is correct.

Be sure that the outer cable end at the clutch lever is fully seated in the adjuster at the clutch lever, or it could slip into place later, creating enough cable play to prevent clutch disengagement.

- After the adjustment, tighten the locknut and start the engine and check that the clutch does not slip and that it releases properly.

Wheels/Tires

Air Pressure Inspection
- Remove the air valve cap.
- Measure the tire air pressure with an air pressure gauge [A] when the tires are cold (that is, when the motorcycle has not been ridden more than a mile during the past 3 hours).
- Install the air valve cap.
  ★ Adjust the tire air pressure according to the specifications if necessary.

Air Pressure (when Cold)
  Front: Up to 180 kg (397 lb)
  225 kPa (2.25 kgf/cm², 32 psi)
  Rear: Up to 180 kg (397 lb)
  250 kPa (2.50 kgf/cm², 36 psi)
2-26 PERIODIC MAINTENANCE

Periodic Maintenance Procedures

Wheel/Tire Damage Inspection

- Remove any imbedded stones [A] or other foreign particles [B] from tread.
- Visually inspect the tire for cracks and cuts, and replace the tire if necessary. Swelling or high spots indicate internal damage, requiring tire replacement.
- Visually inspect the wheel for cracks, cuts and dents damage.
- If any damage is found, replace the wheel if necessary.

Tire Tread Wear, Abnormal Wear Inspection

As the tire tread wears down, the tire becomes more susceptible to puncture and failure. An accepted estimate is that 90% of all tire failures occur during the last 10% of tread life (90% worn). So it is false economy and unsafe to use the tires until they are bald.

- Measure the tread depth at the center of the tread with a depth gauge [A]. Since the tire may wear unevenly, take measurement at several places.
- If any measurement is less than the service limit, replace the tire (see Tire Removal/Installation in the Wheels/Tires chapter).

Tread Depth

| Standard | Front | 6.5 mm (0.26 in.) |
|          | Rear  | 9.0 mm (0.35 in.) |

**WARNING**

To ensure safe handling and stability, use only the recommended standard tires for replacement, inflated to the standard pressure.

**NOTE**

- Most countries may have their own regulations a minimum tire tread depth: be sure to follow them.
- Check and balance the wheel when a tire is replaced with a new one.

Periodic Maintenance Procedures

Wheel Bearing Damage Inspection
• Raise the front wheel off the ground with jack (see Front Wheel Removal in the Wheels/Tires chapter).
• Turn the handlebar all the way to the right or left.
• Inspect the roughness of the front wheel bearing by pushing and pulling [A] the wheel.
• Spin [B] the front wheel lightly, and check for smoothly turn, roughness, binding or noise.
★ If roughness, binding or noise is found, remove the front wheel and inspect the wheel bearing (see Front Wheel Removal, Hub Bearing Inspection in the Wheels/Tires chapter).

• Raise the rear wheel off the ground with stand (see Rear Wheel Removal in the Wheels/Tires chapter).
• Inspect the roughness of the rear wheel bearing by pushing and pulling [A] the wheel.
• Spin [B] the rear wheel lightly, and check for smoothly turn, roughness, binding or noise.
★ If roughness, binding or noise is found, remove the rear wheel and inspect the wheel bearing (see Rear Wheel Removal, Hub Bearing Inspection in the Wheels/Tires chapter) and coupling (see Coupling Bearing Inspection in the Final Drive chapter).

Drive Train

Drive Chain Lubrication Condition Inspection
• If a special lubricant is not available, a heavy oil such as SAE 90 is preferred to a lighter oil because it will stay on the chain longer and provide better lubrication.
• If the chain appears especially dirty, clean it before lubrication.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>The O-rings between the side plates seal in the lubricant between the pin and the bushing. To avoid damaging the O-rings and resultant loss of lubricant, observe the following rules. Use only kerosene or diesel oil for cleaning an O-ring drive chain. Any other cleaning solution such as gasoline or trichloroethylene will cause deterioration and swelling of the O-ring. Immediately blow the chain dry with compressed air after cleaning. Complete cleaning and drying the chain within 10 minutes.</td>
</tr>
</tbody>
</table>
**2-28 PERIODIC MAINTENANCE**

**Periodic Maintenance Procedures**

- Apply oil to the sides of the rollers so that oil will penetrate to the rollers and bushings. Apply the oil to the O-rings so that the O-rings will be coated with oil.
- Wipe off any excess oil.
  - Oil Applied Areas [A]
  - O-rings [B]

**Drive Chain Slack Inspection**

**NOTE**
- Check the slack with the motorcycle setting on its side-stand.
- Clean the chain if it is dirty, and lubricate it if it appears dry.

- Check the wheel alignment (see Wheel Alignment Inspection).
- Rotate the rear wheel to find the position where the chain is tightest.
- Measure the vertical movement (chain slack) [A] midway between the sprockets.
- If the chain slack exceeds the standard, adjust it.

**Chain Slack**

- Standard: 30 – 40 mm (1.2 – 1.6 in.)

**Drive Chain Slack Adjustment**

- Remove the cotter pin [A], and loosen the axle nut [B].
- Loosen the both chain adjuster locknuts [C].
- If the chain is too loose, turn in the left and right chain adjuster nuts [D] evenly.
- If the chain is too tight, turn out the left and right chain adjuster nuts evenly, and kick the wheel forward.
- Turn both chain adjuster nuts evenly until the drive chain has the correct amount of slack. To keep the chain and wheel properly aligned, the value [E] on the left wheel alignment adjuster [F] should align with the same (left or right) edge [G] of inspection window on the swingarm that the right wheel alignment adjuster value aligns with.

**WARNING**

Misalignment of the wheel will result in abnormal wear and may result in an unsafe riding condition.

- Tighten both chain adjuster locknuts securely.
- Tighten the axle nut.

**Torque - Rear Axle Nut:** 108 N·m (11.0 kgf·m, 80 ft·lb)
- Turn the wheel, measure the chain slack again at the tightest position, and readjust if necessary.
Periodic Maintenance Procedures

• Insert a new cotter pin [A].

   **NOTE**
   ○ When inserting the cotter pin, if the slots in the nut do not align with the cotter pin hole in the axle, tighten the nut clockwise [B] up to next alignment.
   ○ It should be within 30°.
   ○ Loosen once and tighten again when the slot goes past the nearest hole.

• Bend the cotter pin [A] over the nut [B].

   **WARNING**
   If the rear axle nut is not securely tightened or the cotter pin is not installed, an unsafe riding condition may result.

Wheel Alignment Inspection

• Check that the value [A] on the left wheel alignment adjuster [B] aligns with the same (left or right) edge [C] of inspection window on the swingarm that the right wheel alignment adjuster value aligns with.

   ★ If they do not, adjust the chain slack and align the wheel alignment (see Drive Chain Slack Adjustment).

   **NOTE**
   ○ Wheel alignment can be also checked using the straightedge or string method.

   **WARNING**
   Misalignment of the wheel will result in abnormal wear, and may result in an unsafe riding condition.
**Drive Chain Wear Inspection**

- **Remove:**
  - Chain Cover (see Swingarm Removal in the Suspension chapter)
  - Rotate the rear wheel to inspect the drive chain for damaged rollers, and loose pins and links.
  - If there is any irregularity, replace the drive chain.
  - Lubricate the drive chain if it appears dry.
  - Stretch the chain taut by hanging a 98 N (10 kg, 20 lb) weight [A] on the chain.
  - Measure the length of 20 links [B] on the straight part [C] of the chain from the pin center of the 1st pin to the pin center of the 21st pin. Since the chain may wear unevenly, take measurements at several places.
  - If any measurements exceed the service limit, replace the chain. Also, replace the front and rear sprockets when the drive chain is replaced.

**Drive Chain 20-link Length**

- **Standard:** 317.5 – 318.2 mm (12.50 – 12.53 in.)
- **Service Limit:** 323 mm (12.7 in.)

**WARNING**

If the drive chain wear exceeds the service limit, replace the chain or an unsafe riding condition may result. A chain that breaks or jumps off the sprockets could snag on the engine sprocket or lock the rear wheel, severely damaging the motorcycle and causing it to go out of control.

For safely, use only the standard chain. It is an endless type and should not be cut for installation.

**Standard Chain**

- **Make:** ENUMA
- **Type:** EK520MVXL1
- **Link:** 114 links

**Chain Guide Inspection**

- **Remove:**
  - Swingarm (see Swingarm Removal in the Suspension chapter)
  - Visually inspect the chain guide [A].
  - Replace the chain guide if it shows any signs of abnormal wear or damage.

**WARNING**

Change the brake fluid in the brake line completely if the brake fluid must be refilled but the type and brand of the brake fluid that is already in the reservoir are unidentified. After changing the fluid, use only the same type and brand of fluid thereafter.

Recommended Disc Brake Fluid

Grade: DOT4

  4. Release the brake [D].

  NOTE
  ○ The fluid level must be checked often during the changing operation and replenished with fresh brake fluid. If the fluid in the reservoir runs out any time during the changing operation, the brakes will need to be bled since air will have entered the brake line.
  ○ Front Brake: Repeat the above steps for the other caliper.

- Remove the clear plastic hose.
- Install the diaphragm and reservoir cap.
- Tighten:
  Torque - Front Brake Reservoir Cap Screws: 1.0 N·m (0.10 kgf·m, 9 in·lb)

- Follow the procedure below to install the rear brake fluid reservoir cap correctly.
  ○ First, tighten the rear brake fluid reservoir cap [B] clockwise [C] by hand until slight resistance is felt indicating that the cap is seated on the reservoir body, then tighten the cap an additional 1/6 turn [D] while holding the brake fluid reservoir body [A].

- Tighten the bleed valve, and install the rubber cap.
  Torque - Bleed Valve: 7.8 N·m (0.80 kgf·m, 69 in·lb)

- After changing the fluid, check the brake for good braking power, no brake drag, and no fluid leakage.
- If necessary, bleed the air from the lines.
Periodic Maintenance Procedures

Master Cylinder Rubber Parts Replacement

Front Master Cylinder Disassembly

- Remove the front master cylinder (see Front Master Cylinder Removal in the Brakes chapter).
- Remove the reservoir cap and diaphragm, and pour the brake fluid into a container.
- Unscrew the locknut and pivot bolt, and remove the brake lever.
- Pull the dust cover [A] out of place, and remove the circlip [B].

Special Tool - Inside Circlip Pliers: 57001-143

- Pull out the piston [C], secondary cup [D], primary cup [E], and return spring [F].

CAUTION
Do not remove the secondary cup from the piston since removal will damage it.

Rear Master Cylinder Disassembly

NOTE
Do not remove the push rod clevis for master cylinder disassembly since removal requires brake position adjustment.

- Remove the rear master cylinder (see Rear Master Cylinder Removal in the Brakes chapter).
- Slide the dust cover on the push rod out of place, and remove the circlip.

Special Tool - Inside Circlip Pliers: 57001-143

- Pull out the push rod with the piston stop.
- Take off the piston [A], secondary cup [B], primary cup [C] and return spring [D].

CAUTION
Do not remove the secondary cup from the piston since removal will damage it.

Master Cylinder Assembly

- Before assembly, clean all parts including the master cylinder with brake fluid or alcohol.

CAUTION
Except for the disc pads and disc, use only disc brake fluid, isopropyl alcohol, or ethyl alcohol for cleaning brake parts. Do not use any other fluid for cleaning these parts. Gasoline, engine oil, or any other petroleum distillate will cause deterioration of the rubber parts. Oil spilled on any part will be difficult to wash off completely, and will eventually deteriorate the rubber used in the disc brake.
2-54 PERIODIC MAINTENANCE

Periodic Maintenance Procedures

- Apply brake fluid to the new parts and to the inner wall of the cylinder.
- Take care not to scratch the piston or the inner wall of the cylinder.
- Tighten the brake lever pivot bolt and locknut.
- Apply silicone grease.
  
  **Brake Lever Pivot Bolt**

- Tighten:
  
  **Torque - Brake Lever Pivot Bolt:** 1.0 N·m (0.10 kgf·m, 9 in·lb)
  
  **Brake Lever Pivot Bolt Locknut:** 5.9 N·m (0.60 kgf·m, 52 in·lb)

**Caliper Rubber Parts Replacement**

**Front Caliper Disassembly**

- Remove:
  
  - Front Caliper (see Front Caliper Removal in the Brakes chapter)
  
  - Brake Pads (see Front Brake Pad Removal in the Brakes chapter)

- Using compressed air, remove the pistons.
  
  ○ Cover the piston area with a clean, thick cloth [A].
  
  ○ Blow compressed air [B] into the hole for the banjo bolt to remove the piston.

  **WARNING**

  To avoid serious injury, never place your fingers or palm in front of the piston. If you apply compressed air into the caliper, the piston may crush your hand or fingers.

  ○ Pull out the pistons by hand.

  - Remove the dust seals [A] and fluid seals [B].
  
  - Remove the bleed valve [C] and rubber cap [D].

  **NOTE**

  ○ If compressed air is not available, with the brake hose still attached, apply the brake lever to remove the piston. The remaining process is as described above.

**Front Caliper Assembly**

- Clean the caliper parts except for the pads.

  **CAUTION**

  For cleaning the parts, use only disc brake fluid, isopropyl alcohol, or ethyl alcohol.

  - Install the bleed valve and rubber cap.

  **Torque - Bleed Valve:** 7.8 N·m (0.80 kgf·m, 69 in·lb)
Periodic Maintenance Procedures

- Replace the fluid seals [A] with new ones.
  ○ Apply brake fluid to the fluid seals, and install them into the cylinders by hand.
- Replace the dust seals [B] with new ones if they are damaged.
  ○ Apply brake fluid to the dust seals, and install them into the cylinders by hand.
- Apply brake fluid to the outside of the pistons, and push them into each cylinder by hand.
- Check the shaft rubber friction boot [A] and the dust cover [B] replace them with new ones if they are damaged.
- Apply a thin coat of PBC (Poly Butyl Cuprysil) grease to the caliper holder shafts [C] and holder holes [D] (PBC is a special high-temperature, water-resistance grease).

- Install the anti-rattle spring [A].
- Install the pads (see Front Brake Pad Installation in the Brakes chapter).
- Wipe up any spilled brake fluid on the caliper with wet cloth.

Rear Caliper Disassembly

- Remove the rear caliper (see Rear Caliper Removal in the Brakes chapter).
- Remove the pads and anti-rattle spring (see Rear Brake Pad Removal in the Brakes chapter).
- Using compressed air, remove the piston.
  ○ Cover the piston area with a clean, thick cloth [B].
  ○ Blow compressed air [A] into the hole for the banjo bolt to remove the piston.

**WARNING**

To avoid serious injury, never place your fingers or palm inside the caliper opening. If you apply compressed air into the caliper, the piston may crush your hand or fingers.

- Remove the dust seal and fluid seal.
- Remove the bleed valve and rubber cap.

**NOTE**

- If compressed air is not available, with the brake hose still attached, apply the brake pedal to remove the piston. The remaining process is as described above.

DFI Servicing Precautions

There are a number of important precautions that should be followed servicing the DFI system.

○ This DFI system is designed to be used with a 12 V sealed battery as its power source. Do not use any other battery except for a 12 V sealed battery as a power source.

○ Do not reverse the battery cable connections. This will damage the ECU.

○ To prevent damage to the DFI parts, do not disconnect the battery cables or any other electrical connections when the ignition switch is on or while the engine is running.

○ Take care not to short the leads that are directly connected to the battery positive (+) terminal to the chassis ground.

○ When charging, remove the battery from the motorcycle. This is to prevent ECU damage by excessive voltage.

○ Do not turn the ignition switch ON while any of the DFI electrical connectors are disconnected. The ECU memorizes service codes.

○ Do not spray water on the electrical parts, DFI parts, connectors, leads, and wiring.

○ Whenever the DFI electrical connections are to be disconnected, first turn off the ignition switch, and disconnect the battery (–) terminal. Do not pull the lead, only the connector. Conversely, make sure that all the DFI electrical connections are firmly reconnected before starting the engine.

○ Connect these connectors until they click [A]

○ If a transceiver is installed on the motorcycle, make sure that the operation of the DFI system is not influenced by electric wave radiated from the antenna. Check operation of the system with the engine at idle. Locate the antenna as far as possible away from the ECU.

○ When any fuel hose is disconnected, fuel may spout out by residual pressure in the fuel line. Cover the hose joint with a piece of clean cloth to prevent fuel spillage.

○ When any fuel hose is disconnected, do not turn on the ignition switch. Otherwise, the fuel pump will operate and fuel will spout from the fuel hose.

○ Do not operate the fuel pump if the pump is completely dry. This is to prevent pump seizure.

○ Before removing the fuel system parts, blow the outer surfaces of these parts clean with compressed air.

○ To prevent corrosion and deposits in the fuel system, do not add to fuel any fuel antifreeze chemicals.
DFI Servicing Precautions

To maintain the correct fuel/air mixture (F/A), there must be no inlet air leaks in the DFI system. Be sure to install the oil filler plug [A] after filling the engine oil.

Troubleshooting the DFI System

Outline

When an abnormality in the system occurs, the FI indicator LED (Light Emitting Diode) light goes on to alert the rider on the meter panel. In addition, the condition of the problem is stored in the memory of the ECU (electronic control unit). With the engine stopped and turned in the self-diagnosis mode, the service code [A] is indicated by the number of times the FI indicator LED light blinks.

When due to a malfunction, the FI indicator LED light remains lit, ask the rider about the conditions [B] under which the problem occurred and try to determine the cause [C].

• First, conduct a self-diagnosis inspection and then a non-self-diagnosis inspection. The non-self-diagnosis items are not indicated by the FI indicator LED light. Don’t rely solely on the DFI self-diagnosis function, use common sense.

Even when the DFI system is operating normally, the FI indicator LED light [A] may light up under strong electrical interference. No repair needed. Turn the ignition switch OFF to stop the indicator light.

When the FI indicator LED light goes on and the motorcycle is brought in for repair, check the service codes.

When the repair has been done, the LED light doesn’t go on. But the service codes stored in memory are not erased to preserve the problem history, and the LED light can display the codes in the self-diagnosis mode. The problem history is referred when solving unstable problems.

When the motorcycle is down, the vehicle-down sensor is turned OFF and the ECU shuts off the fuel injectors and ignition system. The FI indicator LED light blinks but the service code cannot be displayed. The ignition switch is left ON. If the starter button is pushed, the electric starter turns but the engine doesn’t start. To start the engine again, raise the motorcycle, turn the ignition switch OFF, and then ON. The vehicle-down sensor is turned ON and the LED light goes OFF.
Troubleshooting the DFI System

○ The DFI part connectors [A] have seals [B], including the ECU.

• Join the connector and insert the needle adapters [C] inside the seals [B] from behind the connector until the adapter reaches the terminal.

Special Tool - Needle Adapter Set: 57001-1457

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert the needle adapter straight along the terminal in the connector to prevent short-circuit between terminals.</td>
</tr>
</tbody>
</table>

• Make sure that measuring points are correct in the connector, noting the position of the lock [D] and the lead color before measurement. Do not reverse connections of the hand tester or a digital meter.

• Be careful not to short-circuit the leads of the DFI or electrical system parts by contact between adapters.

• Turn the ignition switch ON and measure the voltage with the connector joined.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incorrect, reverse connection or short circuit by needle adapters could damage the DFI or electrical system parts.</td>
</tr>
</tbody>
</table>

○ After measurement, remove the needle adapters and apply silicone sealant to the seals [A] of the connector [B] for waterproofing.

Silicone Sealant (Kawasaki Bond: 56019-120) - Seals of Connector

• Always check battery condition before replacing the DFI parts. A fully charged battery is a must for conducting accurate tests of the DFI system.

• Trouble may involve one or in some cases all items. Never replace a defective part without determining what CAUSED the problem. If the problem was caused by some other item or items, they too must be repaired or replaced, or the new replacement part will soon fail again.

• Measure coil winding resistance when the DFI part is cold (at room temperature).

• Make sure all connectors in the circuit are clean and tight, and examine wires for signs of burning, fraying, short, etc. Deteriorated wires and bad connections can cause reappearance of problems and unstable operation of the DFI system.

★ If any wiring is deteriorated, replace the wiring.
Troubleshooting the DFI System

• Pull each connector [A] apart and inspect it for corrosion, dirt, and damage.
  ★ If the connector is corroded or dirty, clean it carefully. If it is damaged, replace it. Connect the connectors securely.

• Check the wiring for continuity.
  ○ Use the wiring diagram to find the ends of the lead which is suspected of being a problem.
  ○ Connect the hand tester between the ends of the leads.
  ○ Set the tester to the × 1 Ω range, and read the tester.
  ★ If the tester does not read 0 Ω, the lead is defective. Replace the lead or the main harness or the sub harness.

○ If both ends of a harness [A] are far apart, ground [B] the one end [C], using a jumper lead [D] and check the continuity between the end [E] and the ground [F]. This enables to check a long harness for continuity. If the harness is open, repair or replace the harness.

○ When checking a harness [A] for short circuit, open one end [B] and check the continuity between the other end [C] and ground [D]. If there is continuity, the harness has a short circuit to ground, and it must be repaired or replaced.

• Narrow down suspicious locations by repeating the continuity tests from the ECU connectors.
  ★ If no abnormality is found in the wiring or connectors, the DFI parts are the next likely suspects. Check the part, starting with input and output voltages. However, there is no way to check the ECU itself.
  ★ If an abnormality is found, replace the affected DFI part.
  ★ If no abnormality is found in the wiring, connectors, and DFI parts, replace the ECU.

Troubleshooting the DFI System

○ There are two ways to inspect the DFI system. One is voltage Check Method and the other is Resistance Check Method.

(Voltage Check Method)
○ This method is conducted by measuring the input voltage [B] to a sensor [A] first, and then the output voltage [C] from the sensor.
○ Sometimes this method can detect a fault of the ECU.
● Refer to each sensor inspection section for detail in this chapter.
● Use a fully charged battery and a digital meter [D] which can be read two decimal places voltage or resistance.

(Resistance Check Method)
○ This method is simple. No need for a fully charged battery and the needle adapter. Just do the following especially when a sensor [A] is suspect.
● Turn the ignition switch OFF and disconnect the connectors.
● Inspect the sensor resistance, using a digital meter (see each sensor inspection in this chapter).
● Inspect the wiring and connectors [B] for continuity, using the hand tester [C] (analog tester) rather than a digital meter.

Special Tool - Hand Tester: 57001-1394
★ If the sensor, the wiring and connections are good, inspect the ECU for its ground and power supply (see this chapter). If the ground and power supply are good, the ECU is suspect. Replace the ECU.

DFI System Troubleshooting Guide

**NOTE**
- This is not an exhaustive list, giving every possible cause for each problem listed. It is meant simply as a rough guide to assist the troubleshooting for some of the more common difficulties.
- The ECU may be involved in the DFI electrical and ignition system troubles. If these parts and circuits are checked out good, be sure to check the ECU for ground and power supply. If the ground and power supply are checked good, replace the ECU.

Self-Diagnosis

Self-diagnosis Outline

The self-diagnosis system has three modes and can be switched to another mode by grounding the self-diagnosis terminal.

User Mode

The ECU notifies the rider of troubles in DFI system and ignition system by lighting the FI indicator when DFI system and ignition system parts are faulty, and initiates fail-safe function. In case of serious troubles, the ECU stops the injection/ignition/starter motor operation.

Dealer Mode 1

The FI indicator light (LED) emits service code(s) to show the problem(s) which the DFI system, and ignition system has at the moment of diagnosis.

Dealer Mode 2

The FI indicator light (LED) emits service code(s) to show the problem(s) which the DFI system, and ignition system had in the past.

Self-diagnosis Procedures

When a problem occurs with the DFI system and ignition system, the DFI indicator light (LED) [A] goes on.

NOTE

○ Use a fully charged battery when conducting self-diagnosis. Otherwise, the light (LED) blinks very slowly or doesn’t blink.

○ Keep the self-diagnosis terminal grounded during self-diagnosis, with an auxiliary lead.

• Remove the seat (see Seat Removal in the Frame chapter).
• Ground [A] the self-diagnosis terminal [B] (Orange/Black lead) to the battery (–) terminal [C] or battery (–) lead connector, using a wire.

• Turn on the ignition switch.
• Connect an auxiliary lead [E] to the self-diagnosis terminal [G] for grounding.
• To enter the self-diagnosis dealer mode 1, ground [A] the self-diagnosis indicator terminal to the battery (–) terminal for more than 2 seconds [C], and then keep it grounded continuously [D].

○ Count the blinks of the light (LED) to read the service code. Keep the auxiliary lead ground until you finish reading the service code.
3-36 FUEL SYSTEM (DFI)

Self-Diagnosis

- To enter the self-diagnosis dealer mode 2, open [B] and ground [A] the lead more than five times [F] within 2 seconds [C] after the lead is first grounded, and then keep it grounded continuously [D] for more than 2 seconds.

○ Count the blinks of the light (LED) to read the service code. Keep the auxiliary lead ground until you finish reading the service code.
  Auxiliary Lead [E]
  Self-diagnosis Terminal [G]

NOTE
○ To enter the dealer mode 2 from the dealer mode 1, turn off the ignition switch once.

Service Code Clearing Procedures

Service Code Clearing Procedures
- Enter the self-diagnosis dealer mode 2 (see Self-diagnosis Procedures in this chapter).

NOTE
○ Make sure to keep the grounding until the following opening and grounding starts.
- Pull the clutch lever in more than 5 seconds, and then release it.
- Repeat opening [B] and grounding [A] the lead (self-diagnosis terminal) more than five times [F] within 2 seconds [C] after the lead is grounded, and then keep it grounded continuously [D] for more than 2 seconds.
  Auxiliary Lead [E]
  Self-diagnosis Terminal [G]
Self-Diagnosis

Turn the ignition switch OFF

Turn the ignition switch ON, and self-diagnosis mode starts, using an auxiliary lead.

Dealer

Dealer Mode 1.
Ground the self-diagnosis terminal for more than 2 seconds and then keep it grounded.

Dealer Mode 2.
Ground and open the self-diagnosis terminal more than five times within 2 seconds and then keep it grounded.

Fi indicator light (LED) blinks to display the service code for more than 2 seconds.

Locate the problem with the service code table and check and repair DFI or ignition system according to inspection procedure on all service codes.

Remove the auxiliary lead, ending the self-diagnosis mode.

OK

Make sure the Fi indicator light (LED) doesn't go ON.

OK

Run the engine for several minutes at idling and run the motorcycle at 30 km/h (18 mph) or above in order to confirm no problem.

3-38 FUEL SYSTEM (DFI)

Self-Diagnosis

How to Read Service Codes

How to Read Service Codes
- Service codes are shown by a series of long and short blinks of the FI indicator light (LED) as shown below.
- Read 10th digit and unit digit as the FI indicator light (LED) blinks.
- When there are a number of problems, all the service codes can be stored and the display will begin starting from the lowest number service code in the numerical order. Then after completing all codes, the display is repeated until the self-diagnosis indicator terminal is open.
- If there is no problem, no code and unlight.
- For example, if two problems occurred in the order of 21, 12, the service codes are displayed from the lowest number in the order listed.
  (12 → 21) → (12 → 21) → · · · (repeated)

○ If the problem is with the following parts, the ECU cannot memorize these problems, the FI indicator light (LED) doesn’t go on, and no service codes can be displayed.
  - FI Indicator Light (LED)
  - Fuel Pump
  - Fuel Pump Relay
  - DFI Main Relay
  - ECU Power Source Wiring and Ground Wiring (see ECU Inspection)
  - Fuel Injectors

How to Erase Service Codes

How to Erase Service Codes
- Even if the ignition switch is turned OFF, the battery or the ECU are disconnected or the problem is solved, all service codes remain in the ECU.
- Refer to the Service Code Clearing Procedure for the service code erasure.

### Notes:
- The ECU may be involved in these problems. If all the parts and circuits checked out good, be sure to check the ECU for ground and power supply. If the ground and power supply are checked good, replace the ECU.
- When no service code is displayed, the electrical parts of the DFI system has no fault, and the mechanical parts of the DFI system and the engine are suspect.

**Note:**

(1) **D-J Method and α - N Method:** When the engine load is light like at idling or low speed, the ECU determines the injection quantity by calculating from the throttle vacuum (inlet air pressure sensor output voltage) and engine speed (crankshaft sensor output voltage). This method is called D-J method (low-speed mode). As the engine speed increases, and the engine load turns middle to heavy, the ECU determines the injection quantity by calculating from the throttle opening (throttle sensor output voltage) and the engine speed. This method is called α - N method (high-speed mode).

(*) This depends on the number of stopped cylinders.

Output Voltage Inspection

**NOTE**
- The output voltage changes according to the local atmospheric pressure.
- Measure the output voltage at the ECU in the same way as input voltage inspection. Note the following.

**Inlet Air Pressure Sensor Output Voltage**

Connections to ECU
- Meter (+) → Y/BL lead (terminal 17)
- Meter (–) → BR/BK lead (terminal 14)

**Usable Range:** 3.74 – 4.26 V DC at the standard atmospheric pressure (101.32 kPa, 76 cmHg abs.)

- Turn the ignition switch OFF.
- If the output voltage is within the usable range, check the ECU for its ground, and power supply (see ECU Power Supply Inspection).
- If the output voltage is out of the usable range, remove the fuel tank and check the wiring. If the output voltage is 4.8 V, the ECU is normal.

- If the wiring is good, check the sensor for various vacuum.
- If the output voltage for various vacuum is normal, check the ECU for its ground, and power supply (see ECU Power Supply Inspection).
- Remove the inlet air pressure sensor [A] and disconnect the vacuum hose from the sensor.
- Do not disconnect the sensor connector.
- Connect an auxiliary hose [B] to the inlet air pressure sensor.
- Temporarily install the inlet air pressure sensor.
- Connect a commercially available digital meter [C], vacuum gauge [D], the fork oil level gauge [E] and the harness adapter to the inlet air pressure sensor.

**Special Tools - Fork Oil Level Gauge:** 57001-1290
**Sensor Harness Adapter:** 57001-1561

**Inlet Air Pressure Sensor Output Voltage**

Connection to Adapter
- Meter (+) → G (sensor Y/BL) lead
- Meter (–) → BK (sensor BR/BK) lead

- Turn the ignition switch ON.
- Measure the inlet air pressure sensor output voltage from various vacuum readings, while pulling the handle of the fork oil level gauge.
- Check the inlet air pressure sensor output voltage, using the following formula and chart.

Suppose:
- Pg: Vacuum Pressure (gauge) to Sensor
- Pl: Local Atmospheric Pressure (absolute) measured by a barometer
- Pv: Vacuum Pressure (absolute) to Sensor
- Vv: Sensor Output Voltage (v)
Inlet Air Pressure Sensor (Service Code 12)

then

\[ P_v = P_l - P_g \]

For example, suppose the following data is obtained:

- \( P_g = 8 \text{ cmHg} \) (Vacuum gauge reading)
- \( P_l = 70 \text{ cmHg} \) (Varometer reading)
- \( V_v = 3.2 \text{ V} \) (Digital volt meter reading)

then

\[ P_v = 70 - 8 = 62 \text{ cmHg (Abs)} \]

Plot this \( P_v \) (62 cmHg) at a point [1] on the chart and draw a vertical line through the point. Then, you can get the usable range [2] of the sensor output voltage.

Usable range = 3.04 \(-\) 3.49 V

Plot \( V_v \) (3.2 V) on the vertical line. \( \rightarrow \) Point [3].

Results: In the chart, \( V_v \) is within the usable range and the sensor is normal.

\( P_v = 24 \sim 55 \text{ cmHg} \)
Inlet Air Pressure Sensor (Service Code 12)

\[ P_v = 55 - 86 \text{ cmHg} \]

- \( V_v \): Inlet Air Pressure Sensor Output Voltage (V) (Digital Meter Reading)
- \( P_v \): Throttle Vacuum Pressure (Absolute)
- \( P_s \): Standard Atmospheric Pressure (Absolute)

- TO: Throttle Full Open
- ST: Standard of Sensor Output Voltage (v)

Start the engine and switch the diagnosis mode to Dealer 1 mode to know all the problem that the DFI system has at the time of self-diagnosis. If the engine cannot be started, the self-diagnosis system does not detect dynamic condition of the crankshaft sensor. In this case, turn off the ignition switch and turn it on again to enter the Dealer 2 mode. In this mode, the system tells all the troubles which the DFI system had in both static and dynamic conditions.

3-80 FUEL SYSTEM (DFI)

Fuel Line

Fuel Pressure Inspection

**NOTE**
- This inspection can determine which trouble the DFI system has, mechanical or electrical trouble.
- It is preferable to measure the fuel pressure while running the motorcycle just when trouble occurred in order to know symptom well.
- Be sure the battery is fully charged.

- Remove the fuel tank (see Fuel Tank Removal).
- Be sure to place a piece of cloth around the fuel hose joint and the delivery pipe.
- Insert a minus screw driver [A] into the slit on the joint lock [B].
- Turn the driver to disconnect the joint lock.
- Remove the fuel hose [C].

**WARNING**
Be prepared for fuel spillage; any spilled fuel must be completely wiped up immediately.
When the fuel hose is disconnected, fuel spills out from the hose and the pipe because of residual pressure. Cover the hose connection with a piece of clean cloth to prevent fuel spillage.

- Install the fuel pressure gauge adapter [A] and fuel hoses between the fuel pump outlet pipe [B] and the delivery pipe [C].
- Connect the pressure gauge [D] to the fuel pressure gauge adapter.

Special Tools - Oil Pressure Gauge, 5 kgf/cm²: 57001-125
Fuel Pressure Gauge Adapter: 57001-1593

**WARNING**
Do not try to start the engine with the fuel hoses disconnected.

- Temporarily, install the fuel tank [E].
  Clamps [F]
Fuel Line

• Turn the ignition switch ON. The fuel pump will turn for 3 seconds, and then stop.

**CAUTION**

Do not drive the fuel pump without the fuel in the fuel tank.

• Measure the fuel pressure with the engine stopped.

**Fuel Pressure**

Right after Ignition Switch ON, with pump running:

| Standard: 323 kPa (3.3 kgf/cm², 47 psi) |

After 3 seconds from Ignition Switch ON, with pump stopped:

| Standard: 265 kPa (2.7 kgf/cm², 38 psi) (residual fuel pressure) |

The system should hold the residual pressure about 30 seconds.

• Start the engine, and let it idle.

• Measure the fuel pressure with the engine idling.

**Fuel Pressure (Idling)**

| Standard: 333 kPa (3.4 kgf/cm², 48 psi) |

**NOTE**

The gauge needle will fluctuate. Read the pressure at the average of the maximum and minimum indications.

If the fuel pressure is normal, the fuel circulation system (fuel pump, pressure regulator, and fuel passage) is no faults. Check the DFI electronic control system (injectors, sensors, crankshaft sensor, and ECU).

If the fuel pressure is much lower than specified, check the following:

- Fuel Line Leakage
- Fuel Pump Operation (check the sound of the pump)
- Amount of Fuel Flow (see Fuel Flow Rate Inspection)

If the fuel pressure is much higher than specified, check the following:

- Delivery Pipe Clogging
- Injector Clogging

• Remove the fuel pressure gauge and adapter.

• Install the fuel tank (see Fuel Tank Installation).
3-82 FUEL SYSTEM (DFI)

Fuel Line

Fuel Flow Rate Inspection

**NOTE**

○ Be sure the battery is fully charged.

---

**WARNING**

Gasoline is extremely flammable and can be explosive under certain conditions. Make sure the area is well-ventilated and free from any source of flame or sparks; this includes any appliance with a pilot light. Do not smoke. Turn the ignition switch OFF. Be prepared for fuel spillage; any spilled fuel must be completely wiped up immediately.

- Turn the ignition switch, and engine stop switch OFF.
- Wait until the engine cools down.
- Prepare a plastic hose of the inside diameter 7.5 mm (0.30 in.) and a measuring cylinder.
- Remove the fuel tank bolt (see Fuel Tank Removal).
- Open the fuel tank cap [A] to lower the pressure in the tank.

---

**WARNING**

Be prepared for fuel spillage; any spilled fuel must be completely wiped up immediately. When the fuel hose is disconnected, fuel spills out from the hose and the pipe because of residual pressure. Cover the hose connection with a piece of clean cloth to prevent fuel spillage.

- Connect the plastic hose [A] to the fuel pump outlet pipe.
- Secure the plastic hose with a clamp [B].
- Run the other side of the plastic hose into the measuring cylinder [C].

---

**WARNING**

Wipe off spilled out fuel immediately. Be sure to hold the measuring cylinder vertical.

- Temporarily install the fuel tank and close the fuel tank cap.
- With the engine stopped, turn the ignition switch ON. The fuel pump should operate for 3 seconds, and then should stop. Repeat this several times until the plastic hose is filled with fuel.
Fuel Line

CAUTION

Do not drive the fuel pump without the fuel in the fuel tank.

• Measure the discharge for 3 seconds with the plastic hose filled with fuel.
  ○ Repeat this operation several times.

Amount of Fuel Flow

  Standard:  60 mL or more for 3 seconds

★ If the fuel flow is much less than the specified, check the battery condition (see Battery section in the Electrical System chapter). If the battery is good, replace the fuel pump.

• After inspection, install the fuel tank. (see Fuel Tank Installation).

• Start the engine and check for fuel leakage.

Fuel Pump Removal

**CAUTION**

Never drop the fuel pump, especially on a hard surface. Such a shock to the pump can damage it.

**WARNING**

Gasoline is extremely flammable and can be explosive under certain conditions. Make sure the area is well-ventilated and free from any source of flame or sparks; this includes any appliance with a pilot light. Do not smoke. Turn the ignition switch OFF. Disconnect the battery (–) terminal.

  - Fuel Pump [B] and gasket
- Discard the fuel pump gasket.

**CAUTION**

Do not pull the lead of the fuel pump. If they are pulled, the lead terminals may be damaged.

Fuel Pump Installation

- Remove dirt or dust from the fuel pump [A] by lightly applying compressed air.
Fuel Pump

- Replace the fuel pump gasket [A] with a new one.

- Apply a non-permanent locking agent to the threads of the fuel pump bolts.
- Tighten the fuel pump bolts to a snug fit, tighten them alternating diagonally.

  **Torque - Fuel Pump Bolts:** 9.8 N·m (1.0 kgf·m, 87 in·lb)

Fuel Injector Output Voltage Inspection
- Turn the ignition switch OFF.
- Remove the ECU (see ECU Power Supply Inspection).
- Connect a digital voltmeter [A] to the ECU connector [B] with the needle adapter set [C].

Special Tool - Needle Adapter Set: 57001-1457

Injector Output Voltage
Connections to Injector #1
- Meter (+) → BL/R lead (terminal 42)
- Meter (–) → Battery (–) Terminal
Connections to Injector #2
- Meter (+) → BL/G lead (terminal 41)
- Meter (–) → Battery (–) Terminal

- Turn the ignition switch ON.

Output Voltage at Injector Connector
Standard: Battery Voltage (12.8 V or more)

If the output voltage is normal, perform “Injector Signal Test”.
If the output voltage is out of the standard, turn the ignition switch OFF, remove the fuel tank, and check the injector wiring for continuity.

Injector Wiring Inspection
ECU Connector Injector Connectors
- Terminal 36 → Injector #1 Terminal (BL/R)
- Terminal 35 → Injector #2 Terminal (BL/G)

- If the wiring is good, inspect the resistance of the injectors (see Injector Resistance Inspection).
- Remove the needle adapter.
- Apply silicone sealant to the seals of the ECU connector for waterproofing.

Silicone Sealant (Kawasaki Bond: 56019-120) - Seals of ECU Connectors

Injector Signal Test
- Prepare two test light sets with male terminals as shown.
  - Rating of Bulb [A]: 12 V × 3 – 3.4 W
  - Terminal Width [B]: 1.8 mm (0.071 in.)
  - Terminal Thickness [C]: 0.8 mm (0.031 in.)

**CAUTION**
Do not use larger terminals than specified above. A larger terminal could damage the injector main harness connector (female), leading to harness repair or replacement.
Be sure to connect bulbs in series. The bulb works as a current limiter to protect the solenoid in the injector from excessive current.
3-90 FUEL SYSTEM (DFI)

Fuel Injectors

- Remove the fuel tank (see Fuel Tank Removal).
- Remove the air cleaner housing (see Air Cleaner Housing Removal).
- Remove connectors for injector [A].
- Connect each test light set [B] to the injector sub harness connector [C].
- Turn the ignition switch ON.
- While cranking the engine with the starter motor, watch the test lights.
  ★If the test lights flicker at regular intervals, the injector circuit in the ECU, and the wiring are good. Perform the "Injector Resistance Inspection".

Injector signals can be also confirmed by connecting the hand tester (× 10 V AC) instead of the test light set to the injector main harness (female) connector. Crank the engine with the starter motor, and check to see if the hand oscillates at regular intervals.

Special Tool - Hand Tester: 57001-1394

If the test light doesn’t flicker (or the tester needle doesn’t oscillates), check the wiring and connectors again. If the wiring is good, check the injector voltage. If the wiring is good, inspect the ECU for its ground and power supply (see ECU Power Supply Inspection).

Injector Resistance Inspection

- Remove the fuel tank (see Fuel Tank Removal).
- Remove the air cleaner housing (see Air Cleaner Housing Removal).
- Disconnect the connector from the injector [A].
- Measure the injector resistance with the hand tester [B].

Special Tool - Hand Tester: 57001-1394

Legend:
- **Black**: Hot Coolant
- **Light Gray**: Cold Coolant
Permanent type antifreeze is used as a coolant to protect the cooling system from rust and corrosion. When the engine starts, the water pump turns and the coolant circulates.

The thermostat is a wax pellet type which opens or closes with coolant temperature changes. The thermostat continuously changes its valve opening to keep the coolant temperature at the proper level. When coolant temperature is below 80.5 ∼ 83.5°C (177 ∼ 182°F), the thermostat closes so that the coolant flow is restricted through the air bleeder hole, causing the engine to warm up more quickly. When coolant temperature is more than 80.5 ∼ 83.5°C, the thermostat opens and the coolant flows.

When the coolant temperature goes up beyond 93 ∼ 103°C (199 ∼ 217°F), the radiator fan relay conducts to operate the radiator fan. The radiator fan draws air through the radiator core when there is not sufficient air flow such as at low speeds. This increases up the cooling action of the radiator. When the temperature is below 91°C (196°F) ∼ temperature less than ON temperature, the fan relay opens and the radiator fan stops.

In this way, this system controls the engine temperature within narrow limits where the engine operates most efficiently even if the engine load varies.

The system is pressurized by the radiator cap to suppress boiling and the resultant air bubbles which can cause engine overheating. As the engine warms up, the coolant in the radiator and the water jacket expands. The excess coolant flows through the radiator cap and hose to the reserve tank to be stored there temporarily. Conversely, as the engine cools down, the coolant in the radiator and the water jacket contracts, and the stored coolant flows back to the radiator from the reserve tank.

The radiator cap has two valves. One is a pressure valve which holds the pressure in the system when the engine is running. When the pressure exceeds 112.3 ∼ 141.7 kPa (1.15 ∼ 1.45 kgf/cm², 16.3 ∼ 20.5 psi), the pressure valve opens and releases the pressure to the reserve tank. As soon as pressure escapes, the valve closes, and keeps the pressure at 112.3 ∼ 141.7 kPa (1.15 ∼ 1.45 kgf/cm², 16.3 ∼ 20.5 psi). When the engine cools down, another small valve (vacuum valve) in the cap opens. As the coolant cools, the coolant contracts to form a vacuum in the system. The vacuum valve opens and allows the coolant from the reserve tank to enter the radiator.

4-8 COOLING SYSTEM

Coolant

Coolant Deterioration Inspection
• Remove the right center fairing cover (see Center Fairing Removal in the Frame chapter).
• Visually inspect the coolant [A] in the reserve tank.
  ★ If whitish cotton-like wafts are observed, aluminum parts in the cooling system are corroded. If the coolant is brown, iron or steel parts are rusting. In either case, flush the cooling system.
  ★ If the coolant gives off an abnormal smell, check for a cooling system leak. It may be caused by exhaust gas leaking into the cooling system.

Coolant Level Inspection
• Refer to Coolant Level in the Periodic Maintenance chapter.

Coolant Draining
• Refer to Coolant Change in the Periodic Maintenance chapter.

Coolant Filling
• Refer to Coolant Change in the Periodic Maintenance chapter.

Pressure Testing
• Remove the reserve tank (see Coolant Change in the Periodic Maintenance chapter).
• Remove the radiator cap, and install a cooling system pressure tester [A] on the filler neck [B].

  NOTE
  ○ Wet the cap sealing surfaces with water or coolant to prevent pressure leaks.
  • Build up pressure in the system carefully until the pressure reaches 141.7 kPa (1.45 kgf/cm², 20.5 psi).

  CAUTION
  During pressure testing, do not exceed the pressure for which the system is designed. The maximum pressure is 141.7 kPa (1.45 kgf/cm², 20.5 psi).

  • Watch the gauge for at least 6 seconds.
  ★ If the pressure holds steady, the system is all right.
  ★ If the pressure drops and no external source is found, check for internal leaks. Droplets in the engine oil indicate internal leakage. Check the cylinder head gasket and the water pump.
  • Remove the pressure tester, replenish the coolant, and install the radiator cap.
Cooling System Flushing

Over a period of time, the cooling system accumulates rust, scale, and lime in the water jacket and radiator. When this accumulation is suspected or observed, flush the cooling system. If this accumulation is not removed, it will clog up the water passage and considerably reduce the efficiency of the cooling system.

- Drain the cooling system (see Coolant Change in the Periodic Maintenance chapter).
- Fill the cooling system with fresh water mixed with a flushing compound.

**CAUTION**

Do not use a flushing compound which is harmful to the aluminum engine and radiator. Carefully follow the instructions supplied by the manufacturer of the cleaning product.

- Warm up the engine, and run it at normal operating temperature for about ten minutes.
- Stop the engine, and drain the cooling system.
- Fill the system with fresh water.
- Warm up the engine and drain the system.
- Repeat the previous two steps once more.
- Fill the system with a permanent type coolant and bleed the air from the system (see Coolant Change in the Periodic Maintenance chapter).

Coolant Reserve Tank Removal/Installation

- The coolant reserve tank is removed and installed during coolant change (see Coolant Change in the Periodic Maintenance chapter).

  - Special Tool - Bearing Driver Set: 57001-1129

Water Pump Housing Assembly
- Apply a high temperature grease [A] to the new oil seal [B].
- Press the oil seal into the housing with a bearing driver so that the seal surface is flush [C] with the end of the hole.
- Press the new mechanical seal into the housing with the oil seal driver [D] until its flange [E] touches the surface [F] of the housing.
  - Special Tool - Oil Seal Driver: 57001-1660
4-12 COOLING SYSTEM

Water Pump

**Impeller Assembly**
- Clean the sliding surface of the mechanical seal with a high flash-point solvent, and apply a little coolant to the sliding surface to give the mechanical seal initial lubrication.
- Apply coolant to the surfaces of the rubber seal [A] and sealing seat [B], and install the rubber seal and sealing seat into the impeller by pressing them by hand until the seat stops at the bottom of the hole.

**Pump Impeller Inspection**
- Visually check the impeller [A].
- If the surface is corroded, or if the blades are damaged, replace the impeller.
Radiator

Radiator and Radiator Fan Removal

- Drain the coolant (see Coolant Change in the Periodic Maintenance chapter).
- Remove:
  - Left/Right Center Fairing (see Center Fairing in the Frame chapter)
  - Reserve Tank (see Coolant Change in the Periodic Maintenance chapter)
  - Radiator Fan Motor Connector [A] (Disconnect)
  - Radiator Hose Clamp Screw [B] (Loosen)

- Loosen:
  - Radiator Hose Clamp Screw [A]
- Remove:
  - Cotter Pin [B]

- Pull [A] the radiator [B] toward the left, noting the baffle plate [C] on the cylinder head cover.

**CAUTION**

Do not touch the radiator core. This could damage the radiator fins, resulting in loss of cooling efficiency.

- If necessary, remove:
  - Radiator Fan Mounting Bolts [A]
  - Radiator Fan [B]
4-14 COOLING SYSTEM

Radiator

Radiator and Radiator Fan Installation
- Install the grommet [A] so that its large side faces the front.
- Install the radiator [B] to the frame.
  - Align [C] the projection on the radiator with the hole on the frame.
  - Align [D] the projection on the frame with the hole on the radiator.
  - Note the baffle plate on the cylinder head cover when installing the radiator.
  - Position the radiator hose clamp screws [E] as shown.

Radiator Inspection
- Check the radiator core.
  - If there are obstructions to air flow, remove them.
  - If the corrugated fins [A] are deformed, carefully straighten them.
  - If the air passages of the radiator core are blocked more than 20% by unremovable obstructions or irreparably deformed fins, replace the radiator with a new one.

CAUTION
When cleaning the radiator with steam cleaner, be careful of the following to prevent radiator damage:
- Keep the steam gun [A] away more than 0.5 m (1.6 ft) [B] from the radiator core.
- Hold the steam gun perpendicular [C] (not oblique [D]) to the core surface.
- Run the steam gun, following the core fin direction.

Radiator Cap Inspection
- Remove:
  - Reserve Tank (see Coolant Change in the Periodic Maintenance chapter)
  - Radiator Cap
- Check the condition of the bottom [A] and top [B] valve seals and valve spring [C].
  - If any one of them shows visible damage, replace the cap with a new one.

http://mototh.com
Radiator

• Install the cap [A] on a cooling system pressure tester [B].

  **NOTE**
  ○ *Wet the cap sealing surfaces with water or coolant to prevent pressure leaks.*

• Watching the pressure gauge, pump the pressure tester to build up the pressure until the relief valve opens: the gauge needle flicks downward. Stop pumping and measure leak time at once. The relief valve must open within the specified range in the table below and the gauge hand must remain within the same range at least 6 seconds.

  **Radiator Cap Relief Pressure**
  **Standard:** 112.3 – 141.7 kPa (1.15 – 1.45 kgf/cm², 16.3 – 20.5 psi)

  ★ If the cap cannot hold the specified pressure or if it holds too much pressure, replace it with a new one.

**Radiator Filler Neck Inspection**

- Remove the reserve tank (see Coolant Change in the Periodic Maintenance chapter).
- Remove the radiator cap.
- Check the radiator filler neck for signs of damage.
- Check the condition of the top and bottom sealing seats [A] in the filler neck. They must be smooth and clean for the radiator cap to function properly.
4-16 COOLING SYSTEM

Thermostat

Thermostat Removal
- Drain the coolant (see Coolant Change in the Periodic Maintenance chapter).
- Remove:
  - Left Center Fairing (see Center Fairing Removal in the Frame chapter)
  - Thermostat Hosing Bolts [A]
  - Thermostat Hosing [B]

- Pull the thermostat [A] out of the cylinder head.

Thermostat Installation
- Install the thermostat [A] in the cylinder head so that the air bleeder hole [B] is on top.
- Install a new O-ring into the housing and apply grease it.
- Tighten:
  - Torque - Thermostat Hosing Bolts: 9.8 N·m (1.0 kgf·m, 87 in·lb)
- Fill the radiator with coolant (see Coolant Change in the Periodic Maintenance chapter).

Thermostat Inspection
- Remove the thermostat, and inspect the thermostat valve [A] at room temperature.
  - If the valve is open, replace the thermostat with a new one.
Thermostat

• To check valve opening temperature, suspend the thermostat [A] in a container of water and raise the temperature of the water.
  ○ The thermostat must be completely submerged and must not touch the container sides or bottom. Suspend an accurate thermometer [B] in the water so that the heat sensitive portions [C] are located in almost the same depth. It must not touch the container, either.
  ★ If the measurement is out of the specified range, replace the thermostat with a new one.

Thermostat Valve Opening Temperature
80.5 – 83.5°C (177 – 182°F)
**4-18 COOLING SYSTEM**

**Hose and Pipes**

**Hose Installation**
- Install the hoses and pipes, being careful to follow bending direction. Avoid sharp bending, kinking, flattening or twisting.
- Run the hoses (see Cable, Wire, and Hose Routing section in the Appendix chapter).
- Install the clamp [A] as near as possible to the hose end to clear the raised rib of the fitting. This will prevent the hoses from working loose.
  - The clamp screws should be positioned correctly to prevent the clamps from contacting the other parts.
  - **Torque - Radiator Hose Clamp Screws:** 2.0 N·m (0.20 kgf·m, 17 in·lb)

**Hose Inspection**
- Refer to Cooling Hose and Connection Inspection in the Periodic Maintenance chapter.

  - Air Cleaner Housing (see Air Cleaner Housing Removal in the Fuel System (DFI) chapter)
  - Air Switching Valve with Hoses (see Air Switching Valve Removal)
  - Air Suction Valve Cover Bolts [A] and Clamp
  - Air Suction Valve Cover [B]
  - Air Suction Valve [C]

Air Suction Valve Installation

- Install the air suction valve [A] so that its side where stopper is fixed with the screws [B] faces the front [C].
- Tighten:
  Torque - Air Suction Valve Cover Bolts: 9.8 N·m (1.0 kgf·m, 87 in·lb)

Air Suction Valve Inspection

- Remove the air suction valve (see Air Suction Valve Removal).
- Visually inspect the reeds for cracks, folds, warps, heat damage or other damage.
- If there is any doubt as to the condition of the reeds [A], replace the air suction valve as an assembly.
- Check the reed contact areas [B] of the valve holder for grooves, scratches, any signs of separation from the holder or heat damage.
- If there is any doubt as to the condition of the reed contact areas, replace the air suction valve as an assembly.
- If any carbon or other foreign particles have accumulated between the reed and the reed contact area, wash the valve assembly clean with a high-flash point solvent.

CAUTION

Do not scrape off the deposits with a scraper as this could damage the rubber, requiring replacement of the suction valve assembly.

Air Switching Valve Removal

- Remove:
  - Fuel Tank (see Fuel Tank Removal in the Fuel System (DFI) chapter)
  - Air Switching Valve Connector [A] (Disconnect)
  - Vacuum Switch Valve [B]

Clean Air System

Air Switching Valve Installation
- Install the vacuum switch valve so that the vacuum fitting [A] faces left side.
- Route the hoses correctly (see Cable, Wire, and Hose Routing section in the Appendix chapter).

Air Switching Valve Operation Test
- Refer to Air Switching Valve Operation Test in the Electrical System chapter.

Air Switching Valve Unit Test
- Refer to Air Switching Valve Unit Test in the Electrical System chapter.

Clean Air System Hose Inspection
- Be certain that all the hoses are routed without being flattened or kinked, and are connected correctly to the air cleaner housing, air switching valve, #1 and #2 throttle body holders and air suction valve covers.
- If they are not, correct them. Replace them if they are damaged.

Camshaft Chain Tensioner

Camshaft Chain Tensioner Removal

**CAUTION**
This is a non-return type camshaft chain tensioner. The push rod does not return to its original position once it moves out to take up camshaft chain slack. Observe all the rules listed below:
When removing the tensioner, do not take out the mounting bolts only halfway. Retightening the mounting bolts from this position could damage the tensioner and the camshaft chain. Once the bolts are loosened, the tensioner must be removed and reset as described in “Camshaft Chain Tensioner Installation.” Do not turn over the crankshaft while the tensioner is removed. This could upset the camshaft chain timing, and damage the valves.

- Remove:
  - Cap Bolt [A]
  - Washer [B]
  - Spring [C]
- Remove the mounting bolts [D] and take off the camshaft chain tensioner.

Camshaft Chain Tensioner Installation
- Release the stopper [A] and push the push rod [B] into the tensioner [C].
- Install the tensioner so that the stopper faces upward.
- Tighten the tensioner mounting bolts [A].
  **Torque - Camshaft Chain Tensioner Mounting Bolts:** 9.8 N·m (1.0 kgf-m, 87 in-lb)
- Install the spring and washer.
- Tighten the cap bolt [B].
  **Torque - Camshaft Chain Tensioner Cap Bolt:** 20 N·m (2.0 kgf-m, 15 ft-lb)
- Turn the crankshaft 2 turns clockwise to allow the tensioner to expand and recheck the camshaft chain timing.
Camshaft, Camshaft Chain

Camshaft Removal
- Remove:
  - Cylinder Head Cover (see Cylinder Head Cover Removal)
- Position the crankshaft as follows.
  - Remove the upper [A] and lower [B] caps on the clutch cover.

- Using a wrench on the crankshaft rotation bolt, turn the crankshaft clockwise until the 2|T mark line [A] on the timing rotor is aligned with the notch [B] in the edge of the upper hole [C] in the clutch cover.

- Remove:
  - Camshaft Chain Tensioner (see Camshaft Chain Tensioner Removal)
  - Camshaft Cap Bolts [A]
  - Camshaft Caps [B]
  - Camshafts [C]

**CAUTION**
The crankshaft may be turned while the camshafts are removed. Always pull the chain taut while turning the crankshaft. This avoids kinking the chain on the lower (crankshaft) sprocket. A kinked chain could damage both the chain and the sprocket.

Camshaft Installation
- Be sure to install the following parts.
  - Plug Hole Gaskets [A]
  - Dowel Pins [B]

- If a new camshaft is to be used, apply a thin coat of molybdenum disulfide grease to the cam surfaces.

**NOTE**

○ The exhaust camshaft has a 2412 EX mark [D] and the inlet camshaft has a 2412 IN mark [E]. Be careful not to mix up these shafts.

- Position the crankshaft as follows.
- Pull the tension side (exhaust side) of the chain taut to install the chain.
- Engage the camshaft chain with the camshaft sprockets so that the timing marks on the sprockets are positioned as shown.
  ○ Using a wrench on the crankshaft rotation bolt, turn the crankshaft clockwise until the 2|T mark line [A] on the timing rotor is aligned with the notch [B] in the edge of the upper hole [C] in the clutch cover.
- If the clutch cover is removed, perform the next procedure.
  ○ Using a wrench on the crankshaft rotation bolt, turn the crankshaft clockwise until the 1|T mark line [A] on the timing rotor is aligned with the mating surface [B] of the crankcase halves.

Valve Guide Installation

- Apply oil to the valve guide outer surface before installation.
- Heat the area around the valve guide hole to about 120 – 150°C (248 – 302°F).
- Drive the valve guide in from the top of the head using the valve guide arbor. The flange stops the guide from going in too far.

Special Tool - Valve Guide Arbor, 4.5: 57001-1331

- Wait until the cylinder head cools down and then ream the valve guide with the valve guide reamer [A] even if the old guide is reused.
- Turn the reamer in a clockwise direction until the reamer turns freely in the guide. Never turn the reamer counterclockwise or it will be dulled.
- Once the guides are reamed they must be cleaned thoroughly.

Special Tool - Valve Guide Reamer, 4.5: 57001-1333

Valve-to-Guide Clearance Measurement (Wobble Method)

If a small bore gauge is not available, inspect the valve guide wear by measuring the valve to valve guide clearance with the wobble method as indicated below.

- Insert a new valve [A] into the guide [B] and set a dial gauge against the stem perpendicular to it as close as possible to the cylinder head mating surface.
- Move the stem back and forth [C] to measure valve/valve guide clearance.
- Repeat the measurement in a direction at a right angle to the first.
- If the reading exceeds the service limit, replace the guide.

NOTE

○ The reading is not actual valve/valve guide clearance because the measuring point is above the guide.

• Remove the valve (see Valve Removal).
• Check the valve seating surface [A] between the valve [B] and valve seat [C].
  ○ Measure the outside diameter [D] of the seating pattern on the valve seat.
  ★ If the outside diameter is too large or too small, repair the seat (see Valve Seat Repair).

Exhaust  27.6 – 27.8 mm (1.087 – 1.094 in.)
Inlet  32.6 – 32.8 mm (1.283 – 1.291 in.)

○ Measure the seat width [E] of the portion where there is no build-up carbon (white portion) of the valve seat with a vernier caliper.
  Good [F]
  ★ If the width is too wide [G], too narrow [H] or uneven [J], repair the seat (see Valve Seat Repair).

Seat Cutter Operation Care
1. This valve seat cutter is developed to grind the valve for repair. Therefore the cutter must not be used for other purposes than seat repair.
2. Do not drop or shock the valve seat cutter, or the diamond particles may fall off.
3. Do not fail to apply engine oil to the valve seat cutter before grinding the seat surface. Also wash off ground particles sticking to the cutter with washing oil.

**NOTE**
○ Do not use a wire brush to remove the metal particles from the cutter. It will take off the diamond particles.

4. Setting the valve seat cutter holder in position, operate the cutter in one hand. Do not apply too much force to the diamond portion.

**NOTE**
○ Prior to grinding, apply engine oil to the cutter and during the operation, wash off any ground particles sticking to the cutter with washing oil.

5. After use, wash it with washing oil and apply thin layer of engine oil before storing.

Marks Stamped on the Cutter
The marks stamped on the back of the cutter [A] represent the following.
60° ......................... Cutter angle [B]
Ø37.5 ...................... Outer diameter of cutter [C]

Operating Procedures
• Clean the seat area carefully.
• Coat the seat with machinist’s dye.
• Fit a 45° cutter into the holder and slide it into the valve guide.
• Press down lightly on the handle and turn it right or left. Grind the seating surface only until it is smooth.

**CAUTION**
Do not grind the seat too much. Overgrinding will reduce valve clearance by sinking the valve into the head. If the valve sinks too far into the head, it will be impossible to adjust the clearance, and the cylinder head must be replaced.
Valves

- Measure the outside diameter of the seating surface with a vernier caliper.
- If the outside diameter of the seating surface is too small, repeat the 45° grind until the diameter is within the specified range.
  - Widened Width [A] of engagement by machining with 45° cutter
  - Ground Volume [B] by 32° cutter
  - 32° [C]
  - Correct Width [D]
  - Ground Volume [E] by 60° or 55° cutter
  - 60° or 55° [F]

- Measure the outside diameter of the seating surface with a vernier caliper.
- If the outside diameter of the seating surface is too small, repeat the 45° grind [A] until the diameter is within the specified range.
  - Original Seating Surface [B]

NOTE
- Remove all pittings of flaws from 45° ground surface.
- After grinding with 45° cutter, apply thin coat of machinist’s dye to seating surface. This makes seating surface distinct and 32° and 60° (or 55°) grinding operation easier.
- When the valve guide is replaced, be sure to grind with 45° cutter for centering and good contact.

- If the outside diameter [A] of the seating surface is too large, make the 32° grind described below.
- If the outside diameter of the seating surface is within the specified range, measure the seat width as described below.
- Grind the seat at a 32° angle [B] until the seat outside diameter is within the specified range.
- To make the 32° grind, fit a 32° cutter into the holder, and slide it into the valve guide.
- Turn the holder one turn at a time while pressing down very lightly. Check the seat after each turn.

CAUTION
- The 32° cutter removes material very quickly. Check the seat outside diameter frequently to prevent overgrinding.

- After making the 32° grind, return to the seat outside diameter measurement step above.
- To measure the seat width, use a vernier caliper to measure the width of the 45° angle portion of the seat at several places around the seat.
- If the seat width is too narrow, repeat the 45° grind until the seat is slightly too wide, and then return to the seat outside diameter measurement step above.
5-30 ENGINE TOP END

Valves

★ If the seat width is too wide, make the 60° or 55° [A] grind described below.
★ If the seat width is within the specified range, lap the valve to the seat as described below.
• Grind the seat at a 60° or 55° angle until the seat width is within the specified range.
  ○ To make the 60° or 55° grind, fit 60° or 55° cutter into the holder, and slide it into the valve guide.
  ○ Turn the holder, while pressing down lightly.
  ○ After making the 60° or 55° grind, return to the seat width measurement step above.

Correct Width [B]

• Lap the valve to the seat, once the seat width and outside diameter are within the ranges specified above.
  ○ Put a little coarse grinding compound on the face of the valve in a number of places around the valve head.
  ○ Spin the valve against the seat until the grinding compound produces a smooth, matched surface on both the seat and the valve.
  ○ Repeat the process with a fine grinding compound.
    Lapper [A]
    Valve Seat [B]
    Valve [C]

• The seating area should be marked about in the middle of the valve face.
★ If the seat area is not in the right place on the valve, check to be sure the valve is the correct part. If it is, it may have been refaced too much; replace it.
• Be sure to remove all grinding compound before assembly.
• When the engine is assembled, be sure to adjust the valve clearance (see Valve Clearance Adjustment in the Periodic Maintenance chapter).

  Piston Pin Puller Adapter C: 57001-1657 [D]
  Center Bolt [B]
  Shaft of Piston [C]
- Remove the pistons.

- Carefully spread the ring opening with your thumbs and then push up on the opposite side of the ring [A] to remove it.
- Remove the 3-piece oil ring with your thumbs in the same manner.

Piston Installation
- Install the oil ring expander [A] in the bottom piston ring groove so the ends [B] butt together.
- Install the oil ring steel rails, one above the expander and one below it.
  ○ Spread the rail with your thumbs, but only enough to fit the rail over the piston.
  ○ Release the rail into the bottom piston ring groove.

  NOTE
  ○ The oil ring rails have no “top” or “bottom”.
- Do not mix up the top and second ring.
- Install the top ring [A] so that the “R” mark [B] faces up.
- Install the second ring [C] so that the “RN” mark [D] faces up.
NOTE
○ If a new piston is used, use new piston ring.
- Install the piston with its marking hollow facing forward.
- Fit a new piston pin snap ring into the side of the piston so that the ring opening [A] does not coincide with the slit [B] of the piston pin hole.
○ Apply molybdenum disulfide oil solution to the piston pins and piston journals.
○ When installing the piston pin snap ring, compress it only enough to install it and no more.

CAUTION
Do not reuse snap rings, as removal weakens and deforms them. They could fall out and score the cylinder wall.

- Install the cylinder (see Cylinder Installation).

Cylinder Wear
- Since there is a difference in cylinder wear in different directions, take a side-to-side and a front-to-back measurement at each of the two locations (total of four measurements) shown in the figure.
★ If any of the cylinder inside diameter measurements exceeds the service limit, replace the cylinder.
  10 mm (0.39 in.) [A]
  60 mm (2.36 in.) [B]

Cylinder Inside Diameter
- Standard: 82.994 – 83.006 mm (3.2675 – 3.2679 in.)
- Service Limit: 83.10 mm (3.2716 in.)

Piston Wear
- Measure the outside diameter [A] of each piston 18 mm (0.7087 in.) [B] up from the bottom of the piston at a right angle to the direction of the piston pin.
★ If the measurement is under service limit, replace the piston.

Piston Diameter
- Standard: 82.969 – 82.984 mm (3.2665 – 3.2671 in.)
- Service Limit: 82.82 mm (3.2606 in.)
Engine Top End 5-35

Cylinder, Pistons

Piston Ring, Piston Ring Groove Wear
- Check for uneven groove wear by inspecting the ring seating.
- The rings should fit perfectly parallel to groove surfaces.
- If not, replace the piston and all the piston rings.
- With the piston rings in their grooves, make several measurements with a thickness gauge [A] to determine piston ring/groove clearance.

Engine Oil and Oil Filter

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Motorcycle operation with insufficient, deteriorated, or contaminated engine oil will cause accelerated wear and may result in engine or transmission seizure, accident, and injury.</td>
</tr>
</tbody>
</table>

Oil Level Inspection

- Check that the engine oil level is between the upper [A] and lower [B] levels in the gauge.

**NOTE**
- Situate the motorcycle so that it is perpendicular to the ground.
- If the motorcycle has just been used, wait several minutes for all the oil to drain down.
- If the oil has just been changed, start the engine and run it for several minutes at idle speed. This fills the oil filter with oil. Stop the engine, then wait several minutes until the oil settles.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Racing the engine before the oil reaches every part can cause engine seizure. If the engine oil gets extremely low or if the oil pump or oil passages clog up or otherwise do not function properly, the oil pressure warning light will light. If this light stays on when the engine is running above idle speed, stop the engine immediately and find the cause.</td>
</tr>
</tbody>
</table>

- If the oil level is too high, remove the excess oil, using a syringe or some other suitable device.
- If the oil level is too low, add the correct amount of oil through the oil filter opening. Use the same type and make of oil that is already in the engine.

**NOTE**
- If the engine oil type and make are unknown, use any brand of the specified oil to top off the level in preference to running the engine with the oil level low. Then at your earliest convenience, change the oil completely.

Engine Oil Change

- Refer to Engine Oil Change in the Periodic Maintenance chapter.

Oil Filter Replacement

- Refer to Oil Filter Replacement in the Periodic Maintenance chapter.
Oil Pan Removal

- Remove:
  - Engine Oil (drain, see Engine Oil Change in the Periodic Maintenance chapter)
  - Exhaust Pipe (see Exhaust Pipe Removal in the Engine Top End chapter)
  - Muffler Body (see Muffler Body Removal in the Engine Top End chapter)
  - Oil Pan Bolts [A]
  - Oil Pan [B]
  - Gasket [C]
  - Damper [D]

- Remove the following from the oil pan as necessary.
  - Filter Plate Bolts [A]
  - Filter Plate [B]
  - Filter [C]

- Remove the following from the lower crankcase half as necessary.
  - Oil Screen [A]
  - Oil Pipe Plate Bolt [B]
  - Oil Pipe Plate [C]
  - Oil Pipes [D]
  - Oil Pressure Relief Valve [E]
Oil Pan Installation
- Apply grease to the O-rings on the oil pipes [A].
- Install the oil pipe plate [B] so that its guide portion [C] fits the breather pipe [D] as shown.
- Apply a non-permanent locking agent to the oil pipe plate bolt.

**Torque - Oil Pipe Plate Bolt [E]: 9.8 N·m (1.0 kgf·m, 87 in·lb)**

If the oil pressure relief valve [F] was removed, install it.
- Apply a non-permanent locking agent to the threads [G] of the oil pressure relief valve, and tighten it.

**CAUTION**
Do not apply too much non-permanent locking agent to the threads. This may block the oil passage.

**Torque - Oil Pressure Relief Valve: 15 N·m (1.5 kgf·m, 11 ft·lb)**

- Apply grease to the O-ring [A] on the oil screen [B] and install it on the lower crankcase half as shown.
- Be sure the damper [C] is on the end of the breather pipe [D].
- Replace the oil pan gasket with a new one.
- When installing the oil pan, align [A] the damper [B] on the breather pipe with the hollow [C] on the oil pan.
- Tighten:

**Torque - Oil Pan Bolts: 12 N·m (1.2 kgf·m, 106 in·lb)**

Oil Pressure Relief Valve

Oil Pressure Relief Valve Removal
• See Oil Pan Removal.

Oil Pressure Relief Valve Installation
• See Oil Pan Installation.

Oil Pressure Relief Valve Inspection
• Check to see if the valve [A] slides smoothly when pushing it in with a wooden or other soft rod, and see if it comes back to its seat by spring [B] pressure.

NOTE
○ Inspect the valve in its assembled state. Disassembly and assembly may change the valve performance.

★ If any rough spots are found during above inspection, wash the valve clean with a high-flash point solvent and blow out any foreign particles that may be in the valve with compressed air.

WARNING
Clean the oil pressure relief valve in a well-ventilated area, and take care that there is no spark or flame anywhere near the working area. Because of the danger of highly flammable liquids, do not use gasoline or low-flash point solvent.

★ If cleaning does not solve the problem, replace the oil pressure relief valve as an assembly. The oil pressure relief valve is precision made with no allowance for replacement of individual parts.

7-14 ENGINE LUBRICATION SYSTEM

Oil Pressure Measurement

Oil Pressure Measurement
• Remove the lower fairing (see Lower Fairing Removal in the Frame chapter).
• Remove the oil passage plug, and attach the adapter [A] and gauge [B] to the plug hole.

Special Tools - Oil Pressure Gauge, 10 kgf/cm²: 57001-164
Oil Pressure Gauge Adapter, PT3/8 × 19/in.: 57001-1233

• Start the engine and warm up the engine.
• Run the engine at the specified speed, and read the oil pressure gauge.
★ If the oil pressure is much lower than the standard, check the oil pump, relief valve, and/or crankshaft bearing insert wear immediately.
★ If the reading is much higher than the standard, check the oil passages for clogging.

Oil Pressure
Standard: 216 ~ 294 kPa (2.2 ~ 3.0 kgf/cm², 31 ~ 43 psi) @ 4 000 r/min (rpm), oil temperature. 90°C (194°F)

• Stop the engine.
• Remove the oil pressure gauge and adapter.

WARNING
Take care against burns from hot engine oil that will drain through the oil passage when the gauge adapter is removed.

• Apply a non-permanent locking agent to the oil passage plug, and install it.
Torque - Oil Passage Plug (Right): 20 N·m (2.0 kgf·m, 15 ft·lb)

**Oil Pressure Switch Removal**
- Remove or drain:
  - Engine Oil (see Engine Oil Change in the Periodic Maintenance chapter)
  - Switch Cover [A]
  - Switch Terminal Bolt [B]
  - Oil Pressure Switch [C]

**Oil Pressure Switch Installation**
- Apply silicone sealant to the threads of the oil pressure switch and tighten it.

  **Sealant - Kawasaki Bond (Silicone Sealant):** 56019-120

  **Torque - Oil Pressure Switch:** 15 N·m (1.5 kgf·m, 11 ft·lb)

- Tighten the terminal bolt securely.
- Apply a small amount grease to the terminal so that grease should not close the holes [A] of the switch cover.

Crankshaft and Connecting Rods

- Install the crankshaft (see Crankshaft Installation).
- Install each connecting rod on its original crankpin.

**NOTE**
- Install each connecting rod so that its oil jet [A] faces the exhaust side (the front [B]) (see Engine Oil Flow Chart in the Engine Lubrication System chapter).
- The connecting rod big end is bolted using the “plastic region fastening method”.
- This method precisely achieves the needed clamping force without exceeding it unnecessarily, allowing the use of thinner, lighter bolts further decreasing connecting rod weight.
- There are two types of the plastic region fastening. One is a bolt length measurement method and other is a rotation angle method. Observe one of the following two, but the bolt length measurement method is preferable because this is a more reliable way to tighten the big end nuts.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>The connecting rod bolts are designed to stretch when tightened. Never reuse the connecting rod bolts. See the table below for correct bolt and nut usage.</td>

<tbody>
<tr>
<td>Be careful not to overtighten the nuts. The bolts must be positioned on the seating surface correctly to prevent the bolt heads from hitting the crankcase.</td>

(1) Bolt Length Measurement Method
- Be sure to clean the bolts, nuts, and connecting rods thoroughly with a high-flash point solvent, because the new connecting rods, bolts, and nuts are treated with an anti-rust solution.

Crankshaft and Connecting Rods

- Install new bolts in reused connecting rods.
- Dent both bolt head and bolt tip with a punch as shown.
- Before tightening, use a point micrometer [A] to measure the length of new connecting rod bolts and record the values to find the bolt stretch.
  
  Connecting Rod [B]
  Mark here with a punch [C].
  Nuts [D]
  Fit micrometer pins into punch marks [E].

- Apply a small amount of molybdenum disulfide oil solution to the following:
  Threads of Nuts and Bolts
  Seating Surfaces of Nuts and Con-rods

- Tighten the big end nuts until the bolt elongation reaches the length specified in the table.
- Check the length [F] of the connecting rod bolts.
  - If the stretch is more than the usable range, the bolt has stretched too much. An overelongated bolt may break in use.

(2) Rotation Angle Method

- If you don’t have a point micrometer, you may tighten the nuts using the "Rotation Angle Method".
- Be sure to clean the bolts and nuts thoroughly with a high-flash point solvent, because the new bolts and nuts are treated with an anti-rust solution.

**WARNING**

Clean the bolts and nuts in a well-ventilated area, and take care that there is no spark or flame anywhere near the working area. This includes any appliance with a pilot light. Because of the danger or highly flammable liquids, do not use gasoline or low-flash point solvents to clean them.

**CAUTION**

Immediately dry the bolts and nuts with compressed air after cleaning. Clean and dry the bolts and nuts completely.

- Install new bolts in reused connecting rods.
- Apply a small amount of molybdenum disulfide oil to the following:

- First, tighten the nuts to the specified torque. See the table below.
- Next, tighten the nuts 120° ±5°.

Crankshaft/Connecting Rod Cleaning

- After removing the connecting rods from the crankshaft, clean them with a high-flash point solvent.
- Blow the crankshaft oil passages with compressed air to remove any foreign particles or residue that may have accumulated in the passages.

Connecting Rod Bend

- Remove the connecting rod big end bearing inserts, and reinstall the connecting rod big end cap.
- Select an arbor [A] of the same diameter as the connecting rod big end, and insert the arbor through the connecting rod big end.
- Select an arbor of the same diameter as the piston pin and at least 100 mm (3.94 in.) long, and insert the arbor [B] through the connecting rod small end.
- On a surface plate, set the big-end arbor on V block [C].
- With the connecting rod held vertically, use a height gauge to measure the difference in the height of the arbor above the surface plate over a 100 mm (3.94 in.) length to determine the amount of connecting rod bend.
  ★ If connecting rod bend exceeds the service limit, the connecting rod must be replaced.

Connecting Rod Bend

Service Limit: TIR 0.2/100 mm (0.008/3.94 in.)
Crankshaft and Connecting Rods

Connecting Rod Twist
- With the big-end arbor [A] still on V block [C], hold the connecting rod horizontally and measure the amount that the arbor [B] varies from being paralleled with the surface plate over a 100 mm (3.94 in.) length of the arbor to determine the amount of connecting rod twist.
- If connecting rod twist exceeds the service limit, the connecting rod must be replaced.

Connecting Rod Twist
- Service Limit: TIR 0.2/100 mm (0.008/3.94 in.)

Connecting Rod Big End Side Clearance
- Measure connecting rod big end side clearance.
- Insert a thickness gauge [A] between the big end and either crank web to determine clearance.

Connecting Rod Big End Side Clearance
- Standard: 0.13 – 0.38 mm (0.0051 – 0.0150 in.)
- Service Limit: 0.58 mm (0.023 in.)
- If the clearance exceeds the service limit, replace the connecting rod with new one and then check clearance again. If clearance is too large after connecting rod replacement, the crankshaft also must be replaced.

Connecting Rod Big End Bearing Insert/Crankpin Wear
- Measure the bearing insert/crankpin [B] clearance with plastigage [A].
- Tighten the big end nuts to the specified torque (see Connecting Rod Installation).

NOTE
- Do not move the connecting rod and crankshaft during clearance measurement.

CAUTION
- After measurement, replace the connecting rod bolts.

Connecting Rod Big End Bearing Insert/Crankpin Clearance
- Standard: 0.017 – 0.041 mm (0.0001 – 0.0016 in.)
- Service Limit: 0.08 mm (0.0031 in.)
- If the clearance is within the standard, no bearing replacement is required.
- If the clearance is between 0.042 mm (0.00165 in.) and the service limit (0.08 mm, 0.0031 in.), replace the bearing inserts [A] with inserts painted blue [B]. Check insert/crankpin clearance with the plastigage. The clearance may exceed the standard slightly, but it must not be less than the minimum in order to avoid bearing seizure.
- If the clearance exceeds the service limit, measure the diameter of the crankpins.

Crankpin Diameter
- Standard: 37.984 – 38.000 mm (1.4954 – 1.4961 in.)
- Service Limit: 37.97 mm (1.4949 in.)
Crankshaft and Connecting Rods

If any crankpin has worn past the service limit, replace the crankshaft with a new one.

If the measured crankpin diameters are not less than the service limit, but do not coincide with the original diameter markings on the crankshaft, make new marks on it.

**Crankpin Diameter Marks**

- **None** 37.984 – 37.992 mm (1.4954 – 1.4957 in.)
- **Δ** 37.993 – 38.000 mm (1.4958 – 1.4961 in.)

△: Crankpin Diameter Marks, "○" or no mark.

- Measure the connecting rod big end inside diameter, and mark each connecting rod big end in accordance with the inside diameter.
- Tighten the connecting rod big end nuts to the specified torque (see Connecting Rod Installation).

**NOTE**

○ The mark already on the big end should almost coincide with the measurement.

**Connecting Rod Big End Inside Diameter Marks**

- **None** 41.000 – 41.008 mm (1.6142 – 1.6145 in.)
- **○** 41.009 – 41.016 mm (1.6145 – 1.6148 in.)

- Insert a thickness gauge [A] between the crankcase main bearing and the crank web at the No. 2 journal [B] to determine clearance.

- If the clearance exceeds the service limit, replace the crankcase halves as a set.

**NOTE**

○ The upper and lower crankcase halves are machined at the factory in the assembled state, so the crankcase halves must be replaced as a set.

Crankshaft Main Bearing Insert/Journal Wear

- Using a plastigage (press gauge) [A], measure the bearing insert/journal [B] clearance.

**NOTE**

○ Tighten the crankcase bolts to the specified torque (see Crankcase Assembly).

○ Do not turn the crankshaft during clearance measurement.

○ Journal clearance less than 0.025 mm (0.00098 in.) cannot be measured by plastigage, however, using genuine parts maintains the minimum standard clearance.

- If the clearance is within the standard, no bearing replacement is required.

- If the clearance is between 0.037 mm (0.0015 in.) and the service limit (0.07 mm, 0.0028 in.), replace the bearing inserts [A] with inserts painted blue [B]. Check insert/journal clearance with the plastigage. The clearance may exceed the standard slightly, but it must not be less than the minimum in order to avoid bearing seizure.

- If the clearance exceeds the service limit, measure the diameter of the crankshaft main journal.
Crankshaft and Connecting Rods

Crankshaft Main Journal Diameter
Standard: 37.984 – 38.000 mm (1.4954 – 1.4961 in.)
Service Limit: 37.96 mm (1.4945 in.)
★If any journal has worn past the service limit, replace the crankshaft with a new one.
★If the measured journal diameters are not less than the service limit, but do not coincide with the original diameter markings on the crankshaft, make new marks on it.

Crankshaft Main Journal Diameter Marks
None 37.984 – 37.992 mm (1.4954 – 1.4957 in.)

* The bearing inserts for Nos. 1, 2 and 3 journals have oil groove.
Crankshaft and Connecting Rods

- Install the new inserts in the crankcase halves and check insert/journal clearance with the plastigage.
Balancer

Balancer Removal
- Split the crankcase (see Crankcase Splitting).

Balancer Installation
- Apply molybdenum disulfide oil solution to the inside of the balancer shaft bearing insert.
- Assemble the crankcase (see Crankcase Assembly).

Balancer Shaft Bearing Insert/Journal Clearance
- Measure the bearing insert/journal clearance using a plastigage.
  ○ Split the crankcase and wipe each bearing insert and journal surface clean of oil.
  ○ Cut strips of plastigage to bearing insert width, and place a strip on each journal parallel to the balancer shaft so that the plastigage will be compressed between the journal and the bearing insert.
  ○ Install the lower crankcase half, and tighten the case bolts to the specified torque (see Crankcase Assembly).

NOTE
- Do not turn the balancer shaft during clearance measurement.
- Remove the lower crankcase half and measure the plastigage width [A] to determine the bearing insert/journal [B] clearance.
  
  Balancer Shaft Bearing Insert/Journal Clearance
  Standard: 0.011 – 0.033 mm (0.0004 – 0.0013 in.)
  Service Limit: 0.08 mm (0.0031 in.)

★ If the clearance is within the standard, no bearing insert replacement is required.

★ If the clearance is between 0.050 mm and the service limit (0.09 mm), replace the bearing inserts [A] with inserts painted blue [B]. Check insert/journal clearance with a plastigage. The clearance may exceed the standard slightly, but it must not be less than the minimum in order to avoid bearing seizure.

★ If the clearance exceeds the service limit, measure the diameter of the balancer shaft journal.

Balancer Shaft Journal Diameter
Standard: 27.987 – 28.000 mm (1.1019 – 1.1024 in.)
Service Limit: 27.96 mm (1.1008 in.)
If either journal has worn past the service limit, replace the balancer shaft with a new one.

Transmission Shaft Disassembly
- Remove the transmission shafts (see Transmission Shaft Removal).
- Remove the circlips, disassemble the transmission shafts.

Special Tool - Outside Circlip Pliers: 57001-144

CAUTION
Do not apply grease to the balls to hold them in place. This will cause the positive neutral finder mechanism to malfunction.

After assembling the 5th gear with steel balls in place on the output shaft, check the ball-locking effect that the 5th gear doesn’t come out of the output shaft when moving it up and down by hand.
- Check that each gear spins or slides freely on the transmission shafts without binding after assembly.

Shift Drum and Fork Removal
- Remove the transmission assy (see Transmission Assy Removal).
- Remove the shift forks [A] and shift drum [B] (see Transmission Assy Disassembly).

Shift Drum and Fork Installation
- Refer to Transmission Assy Assembly and Installation.

Shift Drum Disassembly
- Refer to Transmission Assy Removal and Disassembly.

Shift Drum Assembly
- Refer to Transmission Assembly and Installation.

Shift Fork Bending
- Visually inspect the shift forks, and replace any fork that is bent. A bent fork could cause difficulty in shifting, or allow the transmission to jump out of gear when under power. 90° [A]

Shift Fork/Gear Groove Wear
- Measure the thickness of the shift fork ears [A], and measure the width [B] of the gear grooves.
  - If the thickness of a shift fork ear is less than the service limit, the shift fork must be replaced.

Shift Fork Ear Thickness
  - Standard: 5.9 – 6.0 mm (0.232 – 0.236 in.)
  - Service Limit: 5.8 mm (0.228 in.)
  - If the gear groove is worn over the service limit, the gear must be replaced.

Gear Groove Width
  - Standard: 6.05 – 6.15 mm (0.238 – 0.242 in.)
  - Service Limit: 6.25 mm (0.246 in.)
9-40 CRANKSHAFT/TRANSMISSION

Transmission

Shift Fork Guide Pin/Drum Groove Wear
- Measure the diameter of each shift fork guide pin [A], and measure the width [B] of each shift drum groove.
- If the guide pin on any shift fork is less than the service limit, the fork must be replaced.

Shift Fork Guide Pin Diameter
- Standard: 6.9 - 7.0 mm (0.272 - 0.276 in.)
- Service Limit: 6.8 mm (0.268 in.)
- If any shift drum groove is worn over the service limit, the drum must be replaced.

Shift Drum Groove Width
- Standard: 7.05 - 7.20 mm (0.278 - 0.283 in.)
- Service Limit: 7.3 mm (0.287 in.)

- Replace any damaged gears or gears with excessively worn dogs or dog holes.
Ball Bearing, Needle Bearing, and Oil Seal

Ball and Needle Bearing Replacement

**CAUTION**

Do not remove the ball or needle bearings unless it is necessary. Removal may damage them.

- Using a press or puller, remove the ball bearing and/or needle bearings.

**NOTE**

○ In the absence of the above mentioned tools, satisfactory results may be obtained by heating the case to approximately 93°C (200°F) max., and tapping the bearing in or out.

**CAUTION**

Do not heat the case with a torch. This will warp the case. Soak the case in oil and heat the oil.

- Using a press and the bearing driver set [A], install the new ball bearing until it stops at the bottom of its housing.
- The new needle bearings must be pressed into the crankcase so that the end is flush with the end of the hole.

Special Tool - Bearing Driver Set: 57001-1129

Ball and Needle Bearing Wear

**CAUTION**

Do not remove the bearings for inspection. Removal may damage them.

- Check the ball bearings.
  ○ Since the ball bearings are made to extremely close tolerances, the wear must be judged by feel rather than measurement. Clean each bearing in a high-flash point solvent, dry it (do not spin the bearing while it is dry), and oil it with engine oil.
  ○ Spin [A] the bearing by hand to check its condition.
  ★ If the bearing is noisy, does not spin smoothly, or has any rough spots, replace it.
- Check the needle bearings.
  ○ The rollers in a needle bearing normally wear very little, and wear is difficult to measure. Instead of measuring, inspect the bearing for abrasion, color change, or other damage.
  ★ If there is any doubt as to the condition of a needle bearing, replace it.

Oil Seal Inspection

- Inspect the oil seals.
  ★ Replace it if the lips are misshapen, discolored (indicating that the rubber has deteriorated), hardened or otherwise damaged.

Wheels (Rims)

Front Wheel Removal

• Remove:
  Brake Caliper Mounting Bolts [A]
  Front Brake Calipers [B]

• Loosen:
  Axle Clamp Bolt [A]
• Remove the front axle [B].

• Remove the lower fairing (see Lower Fairing Removal in the Frame chapter).
• Raise the front wheel off the ground with jack.
  Special Tools - Jack: 57001-1238
    Jack Attachment: 57001-1608
• Pull out the axle to the right and drop the front wheel out of the forks.

CAUTION
Do not lay the wheel on the ground with the discs facing down. This can damage or warp the disc. Place wooden blocks under the wheel so that the disc does not touch the ground.

Front Wheel Installation

NOTE
○ The direction of the wheel rotation [A] is shown by an arrow [B] on the wheel spoke.
• Check the wheel rotation mark on the front wheel and install it.
Wheels (Rims)

- Apply high-temperature grease to the grease seal lips.
- Fit the collars [A] on both sides of the hub.

- Insert the front axle, and tighten the axle.
  - Torque - Front Axle: 108 N·m (11.0 kgf·m, 80 ft·lb)
  - Before tightening the axle clamp bolt on the right front fork leg, pump the front fork up and down 4 or 5 times to allow the right front fork leg to seat on the front axle.

  **NOTE**
  - Put a block in front of the front wheel to stop moving.

- Tighten the axle clamp bolt [A].
  - Torque - Front Axle Clamp Bolt: 34 N·m (3.5 kgf·m, 25 ft·lb)

- Install the lower fairing (see Lower Fairing Installation in the Frame chapter).
- Install the front brake calipers (see Caliper Installation in the Brakes chapter).
- Check the front brake effectiveness (see Brake Operation Inspection in the Periodic Maintenance chapter).

**WARNING**

Do not attempt to drive the motorcycle until a full brake lever is obtained by pumping the brake lever until the pads are against the disc. The brake will not function on the first application of the lever if this is not done.

  Cotter Pin [A]
  Axle Nut [B]
  Washer [C]
  Axle [D] with Washer

- Remove the drive chain [A] from the rear sprocket toward the left.
- Move the rear wheel back and remove it.

CAUTION

Do not lay the wheel on the ground with the disc facing down. This can damage or warp the disc. Place wooden blocks under the wheel so that the disc does not touch the ground.

Rear Wheel Installation

- Apply high-temperature grease to the grease seal lips.
- Fit the collars [A] on the both sides of the hub.
Wheels (Rims)

- Engage the drive chain with the rear sprocket.

**Torque - Rear Axle Nut: 108 N·m (11.0 kgf·m, 80 ft·lb)**

- Insert a new cotter pin [A].

**NOTE**

○ When inserting the cotter pin, if the slots in the nut do not align with the cotter pin hole in the axle, tighten the nut clockwise [B] up to next alignment.
○ It should be within 30°.
○ Loosen once and tighten again when the slot goes past the nearest hole.

- Bend the cotter pin [A] over the nut [B].

**WARNING**

If the rear axle nut is not securely tightened or the cotter pin is not installed, an unsafe riding condition may result.

Wheels (Rims)

Wheel Inspection

- Raise the front/rear wheel off the ground with jack.

  Special Tools - Jack: 57001-1238
  Jack Attachment: 57001-1608

- Spin the wheel lightly, and check for roughness or binding.
  If roughness or binding is found, replace the hub bearings.
- Inspect the wheel for small cracks, dents, bending, or warp.
  If there is any damage to the wheel, replace the wheel.
- Remove the wheel, and support it without the tire by the axle.
- Measure the rim runout, axial [A] and radial [B], with a dial gauge.
  If rim runout exceeds the service limit, check the hub bearings.
  If the problem is not due to the bearings, replace the wheel.

Rim Runout

  Standard:
  Axial         TIR 0.5 mm (0.02 in.) or less
  Radial        TIR 0.8 mm (0.03 in.) or less

  Service Limit:
  Axial         TIR 1.0 mm (0.04 in.)
  Radial        TIR 1.0 mm (0.04 in.)

**WARNING**

Never attempt to repair a damaged wheel. If there is any damage besides wheel bearings, the wheel must be replaced to insure safe operational conditions.

Axle Inspection

- Remove the front and rear axles (see Front/Rear Wheel Removal).
- Visually inspect the front and rear axle for damages.
  If the axle is damaged or bent, replace it.
- Place the axle in V blocks that are 100 mm (3.94 in.) [A] apart, and set a dial gauge [B] on the axle at a point halfway between the blocks. Turn [C] the axle to measure the runout. The difference between the highest and lowest dial readings is the amount of runout.
  If axle runout exceeds the service limit, replace the axle.

Axle Runout/100 mm (3.94 in.)

  Standard:       TIR 0.03 mm (0.0012 in.) or less
  Service Limit:  TIR 0.2 mm (0.008 in.)

Wheels (Rims)

Balance Inspection
- Remove the front and rear wheels (see Front/Rear Wheel Removal).
- Support the wheel so that it can be spun freely.
- Spin the wheel lightly, and mark [A] the wheel at the top when the wheel stops.
  ○ Repeat this procedure several times. If the wheel stops of its own accord in various positions, it is well balanced.
  ★ If the wheel always stops in one position, adjust the wheel balance (see Balance Adjustment).

Balance Adjustment
- If the wheel always stops in one position, provisionally attach a balance weight [A] on the rim at the marking using adhesive tape.
- Rotate the wheel 1/4 turn [B], and see whether or not the wheel stops in this position. If it does, the correct balance weight is being used.
  ★ If the wheel rotates and the weight goes up, replace the weight with the next heavier size. If the wheel rotates and the weight goes down, replace the weight with the next lighter size. Repeat these steps until the wheel remains at rest after being rotated 1/4 turn.
- Rotate the wheel another 1/4 turn and then another 1/4 turn to see if the wheel is correctly balanced.
- Repeat the entire procedure as many times as necessary to achieve correct wheel balance.
- Permanently install the balance weight.

Balance Weight Removal
- Insert a regular tip screwdrivers [A] [B] between the rib [C] and the weight [D] as shown.
- Pry the balance weight with two screwdrivers and remove the balance weight.
- Discard the used balance weight.

CAUTION
Do not tap the screwdrivers. The rim could be damaged.

Balance Weight Installation
- Check if the weight portion has any play on the blade [A] and clip [B].
  ★ If it does, discard it.

WARNING
If the balance weight has any play on the rib of the rim, the blade and/or clip have been stretched. Replace the loose balance weight. Do not reuse used balance weight. Unbalanced wheels can create an unsafe riding condition.

**NOTE**

- Balance weights are available from Kawasaki dealers in 10, 20, and 30 grams (0.35, 0.71, and 1.06 oz.) sizes. An imbalance of less than 10 grams (0.35 oz.) will not usually affect running stability.
- Do not use four or more balance weight (more than 90 gram, 3.17 oz.). If the wheel requires an excess balance weight, disassemble the wheel to find the cause.

- Slip the balance weight [A] onto the rib [B] by pushing or lightly hammering [C] the clip [D].

Tires

Air Pressure Inspection/Adjustment
- Refer to the Air Pressure Inspection in the Periodic Maintenance chapter.

Tire Inspection
- Refer to the Wheel/Tire Damage Inspection in the Periodic Maintenance chapter.

Tire Removal
- Remove:
  Wheel (see Front/Rear Wheel Removal)
  Valve Core (Let out the air)
- To maintain wheel balance, mark the valve stem position on the tire with chalk so that the tire can be reinstalled in the same position.
  Chalk Mark or Yellow Mark [A]
  Air Valve [B]
  Align [C]

- Lubricate the tire beads and rim flanges on both sides with a soap and water solution or rubber lubricant. This helps the tire beads slip off the rim flanges.

  CAUTION

  Never lubricate with engine oil or petroleum distillates because they will deteriorate the tire.

- Remove the tire from the rim using a suitable commercially available tire changer.

  NOTE

  ○ The tires cannot be removed with hand tools because they fit the rims too tightly.

Tire Installation

  WARNING

  Use the same manufacturer’s tires on both front and rear wheels.

- Inspect the rim and tire, and replace them if necessary.
- Clean the sealing surfaces of the rim and tire, and smooth the sealing surfaces of the rim with a fine emery cloth if necessary.
- Remove the air valve and discard it.

  CAUTION

  Replace the air valve whenever the tire is replaced. Do not reuse the air valve.
10-14 WHEELS/TIRES

Tires

- Install a new valve in the rim.
- Remove the valve cap, lubricate the stem seal [A] with a soap and water solution or rubber lubricant, and pull [B] the valve stem through the rim from the inside out until it snaps into place.

- Check the tire rotation mark on the front and rear tires and install them on the rim accordingly.
  - Tire Rotation Mark [A]
  - Rotating Direction [B]

- Position the tire on the rim so that the valve [A] align with the tire balance mark [B] (the chalk mark made during removal, or the yellow paint mark on a new tire).
- Install the tire bead over the rim flange using a suitable commercially available tire changer.
- Lubricate the tire beads and rim flanges with a soap and water solution or rubber lubricant to help seat the tire beads in the sealing surfaces of the rim while inflating the tire.
- Center the rim in the tire beads, and inflate the tire with compressed air until the tire beads seat in the sealing surfaces.

</tbody>
</table>
WHEELS/TIRES 10-15

Tires

- Check to see that the rim lines [A] on both sides of the tire sidewalls are parallel with the rim flanges.
- If the rim flanges and tire sidewall rim lines are not parallel, remove the valve core.
- Lubricate the rim flanges and tire beads.
- Install the valve core and inflate the tire again.
- After the tire beads seat in the rim flanges, check for air leakage.
  ○ Inflate the tire slightly above standard inflation.
  ○ Use a soap and water solution or submerge the tire, and check for bubbles that would indicate leakage.
- Adjust the air pressure to the specified pressure (see Air Pressure Inspection in the Periodic Maintenance chapter).
- Install the air valve cap.
- Adjust the wheel balance (see Balance Adjustment).

Tire Repair

Currently two types of repair for tubeless tires have come into wide use. One type is called a temporary (external) repair which can be carried out without removing the tire from the rim, and the other type is called permanent (internal) repair which requires tire removal. It is generally understood that higher running durability is obtained by permanent (internal) repairs than by temporary (external) ones. Also, permanent (internal) repairs have the advantage of permitting a thorough examination for secondary damage not visible from external inspection of the tire. For these reasons, Kawasaki does not recommend temporary (external) repair. Only appropriate permanent (internal) repairs are recommended. Repair methods may vary slightly from make to make. Follow the repair methods indicated by the manufacturer of the repair tools and materials so that safe results can be obtained.

Hub Bearing

Hub Bearing Removal
- Remove the wheel (see Front/Rear Wheel Removal), and take out the following.
  Collars
  Coupling (Out of rear hub)
  Grease Seals
- Use the bearing remover to remove the hub bearings [A].

**CAUTION**

Do not lay the wheel on the ground with the disc facing down. This can damage or warp the disc. Place wooden blocks under the wheel so that the disc does not touch the ground.

  Special Tool - Bearing Driver Set [C]: 57001-1129

Hub Bearing Inspection
Since the hub bearings are made to extremely close tolerances, the clearance can not normally be measured.

**NOTE**

○ Do not remove any bearings for inspection. If any bearings are removed, they will need to be replaced with new ones.
- Turn each bearing in the hub back and forth [A] while checking for plays, roughness or binding.
  ■ If bearing play, roughness or binding is found, replace the bearing.
- Examine the bearing seal [B] for tears or leakage.
  ■ If the seal is torn or is leaking, replace the bearing.

Sprocket Wear Inspection
- Visually inspect the engine and rear sprocket teeth for wear and damage.
  
  - If the teeth are worn as illustrated, replace the sprocket, and inspect the drive chain wear (see Drive Chain Wear Inspection in the Periodic Maintenance chapter).

  Worn Tooth (Engine Sprocket) [A]
  Worn Tooth (Rear Sprocket) [B]
  Direction of Rotation [C]

**NOTE**
- If a sprocket requires replacement, the chain is probably worn also. When replacing a sprocket, inspect the chain.
11-14 FINAL DRIVE

Sprocket, Coupling

*Rear Sprocket Warp Inspection*

- Raise the rear wheel off the ground with stand so that it will turn freely.
- Set a dial gauge [A] against the rear sprocket [B] near the teeth as shown, and rotate [C] the rear wheel to measure the sprocket runout (warp). The difference between the highest and lowest dial gauge readings is the amount of runout (warp).
- If the runout exceeds the service limit, replace the rear sprocket.

*Rear Sprocket Warp*

**Standard:** 0.4 mm (0.016 in.) or less  
**Service Limit:** 0.5 mm (0.020 in.)

#### 12-8 BRAKES

**Brake Lever, Brake Pedal**

*Brake Lever Position Adjustment*

The brake lever adjuster has 5 positions so that the brake lever position can be adjusted to suit the operator’s hand.

- Push the lever forward and turn the adjuster [A] to align the number with the arrow mark [B] on the lever holder.
- The distance from the grip to the lever is minimum at number 5 and maximum at number 1.

*Brake Pedal Position Inspection*

Calipers

Front Caliper Disassembly

Front Caliper Assembly
- Refer to the Caliper Rubber Parts Replacement in the Periodic Maintenance chapter.

Rear Caliper Disassembly
- Refer to the Caliper Rubber Parts Replacement in the Periodic Maintenance chapter.

Rear Caliper Assembly
- Refer to the Caliper Rubber Parts Replacement in the Periodic Maintenance chapter.

Caliper Fluid Seal Damage

The fluid seal (piston seal) [A] is placed around the piston to maintain clearance between the pad and the disc. If the seal is in a poor condition, it could lead the pad to wear excessively or the brake to drag, which may cause the temperature of the discs or the brake fluid to increase.
- Replace the fluid seal if it exhibits any of the conditions listed below.
  ○ Brake fluid leakage around the pad.
  ○ Brakes overheat.
  ○ Considerable difference in inner and outer pad wear.
  ○ Seal and piston are stuck together.

★ If the fluid seal is replaced, replace the dust seal [B] as well. Also, replace all seals every other time the pads are changed.

Rear Caliper Dust Boot and Friction Boot Damage

- Check that the dust boot [A] and friction boot [B] are not cracked, worn, swollen, or otherwise damaged.
★ If they show any damage, replace it.
Calipers

Caliper Piston and Cylinder Damage
• Visually inspect the pistons [A] and cylinder surfaces [B].
★ Replace the caliper if the cylinder and piston are badly scores or rusty.

Rear Caliper Holder Shaft Wear
The caliper body must slide smoothly on the caliper holder shafts [A]. If the body does not slide smoothly, one pad will wear more than the other, pad wear will increase, and constant drag on the disc will raise brake and brake fluid temperature.
• Check to see that the caliper holder shafts are not badly worn or stepped, and that the rubber friction boots are not damaged.
★ If the rubber friction boot is damaged, replace the rubber friction boot. To replace the friction boot, remove the pads and the caliper bracket.
★ If the caliper holder shaft is damaged, replace the caliper bracket.
Brake Pads

Front Brake Pad Removal
- Remove the front caliper with the hose installed (see Front Caliper Removal).
- Draw out the holder shaft pin [A], and take off the holder shaft [B].
- Remove the pad [C] on the piston side.
- Push the holder [D] towards the piston, and remove the pad of the other side [E] from the holder shaft [F].

Front Brake Pad Installation

- Install the anti-rattle spring in its correct position.
- Install the pad on the piston side first, then install the other pad on the holder.
- Install the front caliper (see Caliper Installation).

WARNING
Do not attempt to drive the motorcycle until a full brake lever is obtained by pumping the brake lever until the pads are against the disc. The brake will not function on the first application of the lever if this is not done.

Rear Brake Pad Removal
- Remove the rear caliper with the hose installed (see Rear Caliper Removal).
- Draw out the holder shaft pin [A], and take off the holder shaft [B].
- Remove the pad [C] on the piston side.
- Push the holder [D] towards the piston, and remove the pad of the other side [E] from the holder shaft [F].

Rear Brake Pad Installation
- Push the caliper piston in by hand as far as it will go.
- Install the anti-rattle spring in its correct position.
- Install the pad on the piston side first, then install the other pad on the holder.
- Install the rear caliper (see Caliper Installation).

WARNING
Do not attempt to drive the motorcycle until a full brake pedal is obtained by pumping the brake pedal until the pads are against the disc. The brake will not function on the first application of the pedal if this is not done.

- Remove the master cylinders (see Front/Rear Master Cylinder Removal).
- Disassemble the front and rear master cylinders.
- Check that there are no scratches, rust or pitting on the inner wall [A] of each master cylinder and on the outside of each piston [B].
  - If a master cylinder or piston shows any damage, replace them.
- Inspect the primary cup [C] and secondary cup [D].
  - If a cup is worn, damaged softened (rotted), or swollen, the piston assembly should be replaced to renew the cups.
  - If fluid leakage is noted at the brake lever, the piston assembly should be replaced to renew the cups.

- Check the dust covers [E] for damage.
  - If they are damaged, replace them.
- Check the piston return springs [F] for any damage.
  - If the springs are damaged, replace them.
- Check that relief port [G] and supply port [H] are not plugged.

Brake Fluid

Brake Fluid Level Inspection
• Refer to the Brake Fluid Level Inspection in the Periodic Maintenance chapter.

Brake Fluid Change
• Refer to the Brake Fluid Change in the Periodic Maintenance chapter.

Brake Line Bleeding
The brake fluid has a very low compression coefficient so that almost all the movement of the brake lever or pedal is transmitted directly to the caliper for braking action. Air, however, is easily compressed. When air enters the brake lines, brake lever or pedal movement will be partially used in compressing the air. This will make the lever or pedal feel spongy, and there will be a loss in braking power.

WARNING
Be sure to bleed the air from the brake line whenever brake lever or pedal action feels soft or spongy after the brake fluid is changed, or whenever a brake line fitting has been loosened for any reason.

NOTE
○ The procedure to bleed the front brake line is as follows.
  Bleeding the rear brake line is the same as for the front brake.

• Remove the reservoir cap [A] and diaphragm.
• Fill the reservoir with fresh brake fluid to the upper level line in the reservoir.
• Slowly pump the brake lever several times until no air bubbles can be seen rising up through the fluid from the holes at the bottom of the reservoir.
  ○ Bleed the air completely from the master cylinder by this operation.

• Remove the rubber cap from the bleed valve [A] on the caliper.
• Attach a clear plastic hose [B] to the bleed valve, and run the other end of the hose into a container.
12-20 BRAKES

Brake Fluid

- Bleed the brake line and the caliper.
  ○ Repeat this operation until no more air can be seen coming out into the plastic hose.
  1. Pump the brake lever until it becomes hard, and apply the brake and hold it [A].
  2. Quickly open and close [B] the bleed valve while holding the brake applied.
  3. Release the brake [C].

NOTE
- The fluid level must be checked often during the bleeding operation and replenished with fresh brake fluid as necessary. If the fluid in the reservoir runs completely out any time during bleeding, the bleeding operation must be done over again from the beginning since air will have entered the line.
- Tap the brake hose lightly from the caliper to the reservoir for more complete bleeding.
- Front Brake: First bleeding the right caliper then repeat the above steps for the left caliper.

- Remove the clear plastic hose.
- Install the diaphragm and reservoir cap.
- Tighten:
  Torque - Front Brake Reservoir Cap Screws: 1.0 N·m (0.10 kgf·m, 9 in·lb)

- Follow the procedure below to install the rear brake fluid reservoir cap correctly.
  ○ First, tighten the rear brake fluid reservoir cap [B] clockwise [C] by hand until slight resistance is felt indicating that the cap is seated on the reservoir body, then tighten the cap an additional 1/6 turn [D] while holding the brake fluid reservoir body [A].

- Tighten the bleed valve, and install the rubber cap.
  Torque - Bleed Valve: 7.8 N·m (0.80 kgf·m, 69 in·lb)
- Check the fluid level (see Brake Fluid Level Inspection in the Periodic Maintenance chapter).
- After bleeding is done, check the brake for good braking power, no brake drag, and no fluid leakage.

<tr>
<td>When working with the disc brake, observe the precautions listed below.</td>
</tr>
<tr>
<td>1. Never reuse old brake fluid.</td>
</tr>
<tr>
<td>2. Do not use fluid from a container that has been left unsealed or that has been open for a long time.</td>
</tr>
<tr>
<td>3. Do not mix two types and brands of fluid for use in the brake. This lowers the brake fluid boiling point and could cause the brake to be ineffective. It may also cause the rubber brake parts to deteriorate.</td>
</tr>
<tr>
<td>4. Don't leave the reservoir cap off for any length of time to avoid moisture contamination of the fluid.</td>
</tr>
<tr>
<td>5. Don't change the fluid in the rain or when a strong wind is blowing.</td>
</tr>
<tr>
<td>6. Except for the disc pads and disc, use only disc brake fluid, isopropyl alcohol, or ethyl alcohol for cleaning of the brake parts. Do not use any other fluid for cleaning these parts. Gasoline, engine oil, or any other petroleum distillate will cause deterioration of the rubber parts. Oil spilled on any part will be difficult to wash off completely and will eventually deteriorate the rubber used in the disc brake.</td>
</tr>
<tr>
<td>7. When handling the disc pads or disc, be careful that no disc brake fluid or any oil gets on them. Clean off any fluid or oil that inadvertently gets on the pads or disc with a high-flash point solvent. Do not use one which will leave an oily residue. Replace the pads with new ones if they cannot be cleaned satisfactorily.</td>
</tr>
<tr>
<td>8. Brake fluid quickly ruins painted surfaces; any spilled fluid should be completely wiped up immediately.</td>
</tr>
<tr>
<td>9. If any of the brake line fittings or the bleed valve is opened at any time, the air must be bled from the brake line.</td>

Front Fork

Front Fork Removal

- Remove:
  - Front Wheel (see Front Wheel Removal in the Wheels/Tires chapter)
  - Front Fender (see Front Fender Removal in the Frame chapter)
- Loosen the upper fork clamp bolt [A] and fork top plug [B] beforehand if the fork leg is to be disassembled.

  **NOTE**
  - Loosen the top plug after loosening the upper fork clamp bolt.
- Loosen the upper fork clamp bolt and lower fork clamp bolts [C].
- With a twisting motion, work the fork leg down and out.

Front Fork Installation

- Install the fork with the upper end of the inner tube flush [A] against the top surface of the stem head [B].
- Tighten:
  - Torque - Front Fork Clamp Bolts (Lower): 20 N·m (2.0 kgf·m, 15 ft·lb)
  - Front Fork Top Plug: 25 N·m (2.5 kgf·m, 18 ft·lb)

  **NOTE**
  - Tighten the top plug before tightening the upper fork clamp bolt.
  - Tighten the two clamp bolts alternately two times to ensure even tightening torque.
- Tighten:
  - Torque - Front Fork Clamp Bolt (Upper): 20 N·m (2.0 kgf·m, 15 ft·lb)
- Install the removed parts (see appropriate chapters).

Front Fork Oil Change

- Remove the front fork (see Front Fork Removal).
- Remove:
  - Top Plug [A] with O-ring
  - Collar [B]
  - Fork Spring Seat [C]
  - Fork Spring [D]
13-10 SUSPENSION

Front Fork

• Compress [A] the fork [B] upside down to draw out the oil into the suitable container [C].
• Pour in the specified amount of oil.

Fork Oil

Viscosity: KAYABA KHL34-G10 or equivalent

Amount (Per Side):
- When changing oil: approx. 390 mL (13.2 US oz.)
- After disassembly and completely dry: 458 ±4 mL (15.5 ±0.14 US oz.)

NOTE

○ Move the outer tube up and down a few times to remove the air that is trapped in the fork oil in order to stabilize the oil level.

• Hold the outer tube vertically in a vise and compress the fork completely.
• Wait until the oil level stabilizes.
• Use the fork oil level gauge [A] to measure the distance between the top of the inner tube to the oil level.

Special Tool - Fork Oil Level Gauge: 57001-1290

○ Set the oil level gauge stopper [B] so that the distance [C] from the bottom of the stopper to the lower end of the pipe is the standard oil level distance.
○ A correct measurement can not be obtained unless the level gauge pipe is placed in the center of the inner tube.

Oil Level (fully compressed, without spring)

Standard: 115 ±2 mm (4.5 ±0.08 in.)

○ Place the stopper of the level gauge at the top [D] of the inner tube [E] and pull the handle slowly to draw out the excess oil from fork into the gauge, thus attaining the standard level.
○ If not oil is drawn out, there is not enough oil in the fork. Pour in some more oil and measure again.

• Repeat the same procedure for adjusting the other fork.
• Install the fork spring [A], fork spring seat [B] and collar [C].
• Inspect the top plug O-ring and replace it with a new one.
• Install the front fork (see Front Fork Installation).
Front Fork

**Front Fork Disassembly**
- Remove the front fork (see Front Fork Removal).
- Remove the top plug [A] with O-ring, take out the collar [B], fork spring seat [C], and fork spring [D].
- Drain the fork oil (see Front Fork Oil Change).

- Remove the Allen bolt [A] from the bottom of the fork.

  **Special Tools - Fork Cylinder Holder Handle [B]: 57001-183**
  **Fork Cylinder Holder Adapter [C]: 57001-1057**

  **NOTE**
  ○Hold the outer tube in a vise [D], stop the cylinder unit [E] from turning by using the special tools, and unscrew the Allen bolt.

- Remove the cylinder unit [A], washer, and the spring [B] from the inner tube.

- Remove the following from the top of the outer tube.
  Dust Seal [A]
  Retaining Ring [B]

- Separate the inner tube [A] from the outer tube [B].

  **NOTE**
  ○From the compressed state, firmly pull down the outer tube a few times towards the direction of elongation.
13-12 SUSPENSION

- Remove the following from the inner tube.
  - Inner Guide Bushing [A]
  - Outer Guide Bushing [B]
  - Washer [C]
  - Oil Seal [D]

- Remove the cylinder base [A] from the bottom of the outer tube.

Front Fork Assembly

- Check the top plug O-ring and replace it with a new one.

http://mototh.com
Front Fork

- Apply non-permanent locking agent to the threads of the bottom Allen bolt [A].
- Hold the front fork horizontally in a vise [B].
- Hold the cylinder unit [C] with the special tools and tighten the bottom Allen bolt to secure the cylinder in place.

Torque - Front Fork Bottom Allen Bolt: 30 N·m (3.1 kgf·m, 22 ft·lb)

Special Tools - Fork Cylinder Holder Handle [D]: 57001-183
Fork Cylinder Holder Adapter [E]: 57001-1057

- Pour in the specified type of oil (see Front Fork Oil Change).

Inner Tube Inspection

- Visually inspect the inner tube [A], and repair any damage.
- Nicks or rust damage can sometimes be repaired by using a wet-stone to remove sharp edges or raised areas which cause seal damage.
  - If the damage is not repairable, replace the inner tube.
  - Since damage to the inner tube damages the oil seal, replace the oil seal whenever the inner tube is repaired or replaced.

CAUTION

If the inner tube is badly bent or creased, replace it. Excessive bending, followed by subsequent straightening, can weaken the inner tube.

- Temporarily assemble the inner and outer tubes, and pump them back and forth manually to check for smooth operation.
- If you feel binding or catching, the inner and outer tubes must be replaced.

WARNING

A straightened inner or outer fork tube may fall in use, possibly causing an accident. Replace a badly bent or damaged inner or outer tube and inspect the other tube carefully before reusing it.

Dust Seal Inspection

- Inspect the dust seal [A] for any signs of deterioration or damage.
  - Replace it if necessary.
Fork Spring Inspection

- Measure the free length [A] of the fork spring [B].
- If the measured length is shorter than the service limit, the spring must be replaced. If the free length of the replacement spring and that of the remaining spring vary greatly, the remaining spring should also be replaced in order to keep the fork legs balanced to ensure stability.

Precautions

- Do not reverse the battery cable connections. This will burn out the diodes on the electrical parts.
- Always check battery condition before condemning other parts of an electrical system. A fully charged battery is a must for conducting accurate electrical system tests.
- The electrical parts should never be struck sharply, as with a hammer, or allowed to fall on a hard surface. Such a shock to the parts can damage them.
- To prevent damage to electrical parts, do not disconnect the battery cables or any other electrical connections when the ignition switch is on, or while the engine is running.
- Because of the large amount of current, never keep the starter button pushed when the starter motor will not turn over, or the current may burn out the starter motor windings.
- Do not use a meter illumination bulb rated for other than voltage or wattage specified in the wiring diagram, as the meter or gauge panel could be warped by excessive heat radiated from the bulb.
- Take care not to short the cables that are directly connected to the battery positive (+) terminal to the chassis ground.
- Troubles may involve one or in some cases all items. Never replace a defective part without determining what CAUSED the failure. If the failure was caused by some other item or items, they must be repaired or replaced, or the new replacement will soon fail again.
- Make sure all connectors in the circuit are clean and tight, and examine wires for signs of burning, fraying, etc. Poor wires and bad connections will affect electrical system operation.
- Measure coil and winding resistance when the part is cold (at room temperature).

Electrical Wiring

Wiring Inspection

• Visually inspect the wiring for signs of burning, fraying, etc.
• If any wiring is poor, replace the damaged wiring.
• Pull each connector [A] apart and inspect it for corrosion, dirt, and damage.
• If the connector is corroded or dirty, clean it carefully. If it is damaged, replace it.
• Check the wiring for continuity.
  ○ Use the wiring diagram to find the ends of the lead which is suspected of being a problem.
  ○ Connect the hand tester between the ends of the leads.

Special Tool - Hand Tester: 57001-1394

○ Set the tester to the × 1 Ω range, and read the tester.

★ If the tester does not read 0 Ω, the lead is defective. Replace the lead or the wiring harness [B] if necessary.
Battery

**Battery Removal**

- Remove:
  - Seat (see Seat Removal in the Frame chapter)
  - Disconnect the negative (−) cable [A].
  - Slide out the positive (+) terminal cap [B] and then disconnect the positive (+) cable.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Be sure to disconnect the negative (−) cable first.</td>
</tr>
</tbody>
</table>

- Remove the battery.

**Battery Installation**

- Put the battery into the rear fender front.
- Apply a light coat of grease on the terminals to prevent corrosion.
- Install the positive (+) cable [A] first.
- Cover the positive (+) terminal with the cap [B].
- Install the negative (−) cable [C].

**Battery Activation**

**Electrolyte Filling**

- Make sure that the model name [A] of the electrolyte container matches the model name [B] of the battery. These names must be the same.

**Battery Model Name for ER650A: YTX12-BS**

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Be sure to use the electrolyte container with the same model name as the battery since the electrolyte volume and specific gravity vary with the battery type. This is to prevent overfilling of the electrolyte, shorting the battery life, and deterioration of the battery performance.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not remove the aluminum sealing sheet [A] from the filler ports [B] until just prior to use. Be sure to use the dedicated electrolyte container for correct electrolyte volume.</td>
</tr>
</tbody>
</table>

- Place the battery on a level surface.
- Check to see that the sealing sheet has no peeling, tears, or holes in it.
- Remove the sealing sheet.

**NOTE**

○ The battery is vacuum sealed. If the sealing sheet has leaked air into the battery, it may require a longer initial charge.
**16-20 ELECTRICAL SYSTEM**

**Battery**

- Remove the electrolyte container from the vinyl bag.
- Detach the strip of caps [A] from the container and set aside, these will be used later to seal the battery.

**NOTE**
- Do not pierce or otherwise open the sealed cells [B] of the electrolyte container. Do not attempt to separate individual cells.

- Place the electrolyte container upside down with the six sealed cells into the filler ports of the battery. Hold the container level, push down to break the seals of all six cells. You will see air bubbles rising into each cell as the ports fill.

**NOTE**
- Do not tilt the electrolyte container

- Check the electrolyte flow.
  - If no air bubbles [A] are coming up from the filler ports, or if the container cells have not emptied completely, tap the container [B] a few times.

- Keep the container in place for 20 minutes or more. Don’t remove the container from the battery until it’s empty, the battery requires all the electrolyte from the container for proper operation.

**CAUTION**

| Removal of the container before it is completely empty can shorten the service life of the battery. Do not remove the electrolyte container until it is completely empty and 20 minutes have elapsed. |

- Gently remove the container from the battery.
- Let the battery sit for 30 minutes prior to charging to allow the electrolyte to permeate into the plates for optimum performance.

**NOTE**
- Charging the battery immediately after filling can shorten service life. Let the battery sit for at least 30 minutes after filling.
Battery

Initial Charge
● Place the strip [A] of caps loosely over the filler ports.
● Newly activated sealed batteries require an initial charge.

Standard Charge: 1.2 A × 5 – 10 hours
★ If using a recommended battery charger, follow the charger's instructions for newly activated sealed battery.

Kawasaki-recommended chargers
Optimate III
Yuasa 1.5 Amp Automatic Charger
Battery Mate 150-9
★ If the above chargers are not available, use equivalent one.

NOTE
○ Charging rates will vary depending on how long the battery has been stored, temperature, and the type of charger used. Let battery sit 30 minutes after initial charge, then check voltage using a voltmeter. If it is not at least 12.8 V, repeat charging cycle.

● After charging is completed, press down firmly with both hands to seat the strip of caps [A] into the battery (don’t pound or hammer.). When properly installed, the strip of the caps will be level with the top of the battery.

CAUTION
Once the strip of the caps [A] is installed onto the battery, never remove the caps, nor add water or electrolyte to the battery.

NOTE
○ To ensure maximum battery life and customer satisfaction, it is recommended the battery be load tested at three times its amp-hour rating for 15 seconds. Re-check voltage and if less than 12.8 V repeat the charging cycle and load test. If still below 12.8 V the battery is defective.
16-22 ELECTRICAL SYSTEM

Battery

Precautions
1) No need of topping-up
   No topping-up is necessary in this battery until it ends its life under normal use. *Forcibly prying off the seal cap to add water is very dangerous. Never do that.*

2) Refreshing charge.
   If an engine will not start, a horn sounds weak, or lamps are dim, it indicates the battery has been discharged. Give refresh charge for 5 to 10 hours with charge current shown in the specification (see Specifications).
   When a fast charge is inevitably required, do it following precisely the maximum charge current and time conditions indicated on the battery.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>This battery is designed to sustain no unusual deterioration if refresh-charged according to the method specified above. However, the battery’s performance may be reduced noticeably if charged under conditions other than given above. Never remove the seal cap during refresh charge.</td>
</tr>
<tr>
<td>If by chance an excessive amount of gas is generated due to overcharging, the relief valve releases the gas to keep the battery normal.</td>
</tr>
</tbody>
</table>

3) When you do not use the motorcycle for months.
   Give a refresh charge before you store the motorcycle and store it with the negative cable removed. Give a refresh charge **once a month** during storage.

4) Battery life.
   If the battery will not start the engine even after several refresh charges, the battery has exceeded its useful life. Replace it (Provided, however, the vehicle’s starting system has no problem).

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keep the battery away from sparks and open flames during charging, since the battery gives off an explosive gas mixture of hydrogen and oxygen. When using a battery charger, connect the battery to the charger before turning on the charger.</td>
</tr>
<tr>
<td>This procedure prevents sparks at the battery terminals which could ignite any battery gases.</td>
</tr>
<tr>
<td>No fire should be drawn near the battery, or no terminals should have the tightening loosened.</td>
</tr>
<tr>
<td>The electrolyte contains sulfuric acid. Be careful not to have it touch your skin or eyes. If touched, wash it off with liberal amount of water. Get medical attention if severe.</td>
</tr>
</tbody>
</table>

Interchange
A sealed battery can fully display its performance only when combined with a proper vehicle electric system. Therefore, replace a sealed battery only on a motorcycle which was originally equipped with a sealed battery.
Be careful, if a sealed battery is installed on a motorcycle which had an ordinary battery as original equipment, the sealed battery’s life will be shortened.

Battery Charging Condition Inspection

- Battery charging condition can be checked by measuring battery terminal voltage with a digital voltmeter [A].
- Remove:
  - Seat (see Seat Removal in the Frame chapter)
  - Battery Cable Cap (see Battery Removal)
- Disconnect the battery terminals.

**CAUTION**

Be sure to disconnect the negative (−) cable first.

- Measure the battery terminal voltage.

**NOTE**

- Measure with a digital voltmeter which can be read one decimal place voltage.

If the reading is 12.8 V or more, no refresh charge is required, however, if the read is below the specified, refresh charge is required.

**Refreshing Charge**

- Remove the battery [A] (see Battery Removal).
- Do refresh charge by following method according to the battery terminal voltage.

**WARNING**

This battery is sealed type. Never remove sealing cap [B] even at charging. Never add water. Charge with current and time as stated below.

Battery

Terminal Voltage: 11.5 – less than 12.8 V
Standard Charge 1.2 A x 5 – 10 h (see following chart)
Quick Charge 5 A x 1 h

CAUTION
If possible, do not quick charge. If quick charge is done unavoidably, do standard charge later on.

Terminal Voltage: less than 11.5 V
Charging Method 1.2 A x 20 h

NOTE
○ Increase the charging voltage to a maximum voltage of 25 V if the battery will not accept current initially. Charge for no more than 5 minutes at the increased voltage then check if the battery is drawing current. If the battery will accept current decrease the voltage and charge by the standard charging method described on the battery case. If the battery will not accept current after 5 minutes, replace the battery.

  Special Tools - Grip: 57001-1591
  Rotor Holder: 57001-1658
- Using the flywheel puller [A], remove the alternator rotor from the crankshaft.
  Special Tool - Flywheel Puller Assembly, M38 × 1.5/M35 × 1.5: 57001-1405

| CAUTION |
| Do not attempt to strike the alternator rotor itself. Striking the rotor can cause the magnets to lose their magnetism. |

Alternator Rotor Installation

- Using a cleaning fluid, clean off any oil or dirt on the following portions and dry them with a clean cloth.
  Crankshaft Tapered Portion [A]
  Alternator Rotor Tapered Portion [B]
- Apply a thin coat of molybdenum disulfide grease to the crankshaft [C].
Charging System

- Install the starter gear [A] and washer [B].
- Again, clean the crankshaft tapered portion [C] and dry there.

- Install the alternator rotor [A] while turning [B] it counterclockwise.

- Install the washer [A].

**NOTE**

- Confirm the alternator rotor fit or not to the crankshaft before tightening it with specified torque.
- Apply molybdenum disulfide oil solution to the threads and seating surface of the rotor bolt.
- Install the rotor bolt [B] and tighten it with 70 N·m (7.0 kgf·m, 52 ft·lb) of torque.

  ★If the rotor is pulled out with under 20 N·m (2.0 kgf·m, 15 ft·lb) of drawing torque, clean off any oil dirt or flaw of the crankshaft and rotor tapered portion, and dry them with a clean cloth. Then, confirm that it is not pulled out with above torque.

- Tighten the alternator rotor bolt while holding the alternator rotor steady with the rotor holder.

**Special Tools - Grip:** 57001-1591
**Rotor Holder:** 57001-1658

**Torque - Alternator Rotor Bolt:** 155 N·m (15.8 kgf·m, 114 ft·lb)
16-28 ELECTRICAL SYSTEM

Charging System

- Apply a thin coat of molybdenum disulfide grease to the shafts [A], and install them.
- Install the torque limiter [B] and starter idle gear [C].
- Install the alternator cover (see Alternator Cover Installation).

Alternator Inspection

There are three types of alternator failures: short, open (wire burned out), or loss in rotor magnetism. A short or open in one of the coil wires will result in either a low output, or no output at all. A loss in rotor magnetism, which may be caused by dropping or hitting the alternator, by leaving it near an electromagnetic field, or just by aging, will result in low output.

- To check the alternator output voltage, do the following procedures.
  ○ Turn off the ignition switch.
  ○ Disconnect the alternator lead connector [A].
  ○ Connect the hand tester as shown in the table 1.
  ○ Start the engine.
  ○ Run it at the rpm given in the table 1.
  ○ Note the voltage readings (total 3 measurements).

Table 1 Alternator Output Voltage

</table>

★ If the output voltage shows the value in the table, the alternator operates properly.
★ If the output voltage shows a much higher than the value in the table, the regulator/rectifier is damaged. A much lower reading than that given in the table indicates that the alternator is defective.

- Check the stator coil resistance as follows.
  ○ Stop the engine.
  ○ Connect the hand tester as shown in the table 2.
  ○ Note the readings (total 3 measurement).

**ELECTRICAL SYSTEM 16-29**

**Charging System**

- If there is more resistance than shown in the table, or no hand tester reading (infinity) for any two leads, the stator has an open lead and must be replaced. Much less than this resistance means the stator is shorted, and must be replaced.
- Using the highest resistance range of the hand tester, measure the resistance between each of the black leads and chassis ground.
- Any hand tester reading less than infinity (\(\infty\)) indicates a short, necessitating stator replacement.
- If the stator coils have normal resistance, but the voltage check showed the alternator to be defective, then the rotor magnets have probably weakened, and the rotor must be replaced.

Special Tool - Hand Tester: 57001-1394

**Regulator/Rectifier Inspection**

- Remove:
  - Bolts [A]

  - Disconnect the connector [A].
  - Remove the regulator/rectifier [B].

**Rectifier Circuit Check**

- Check conductivity of the following pair of terminals.

**Rectifier Circuit Inspection**

<table>
<thead>

<th>Tester connection</th>
<th>W/BL-BK1, W/BL-BK2, W/BL-BK3</th>
<th>BK/Y-BK1, BK/Y-BK2, BK/Y-BK3</th>
</tr>
</thead>
</table>

- The resistance should be low in one direction and more than ten times as much in the other direction. If any two leads are low or high in both directions, the rectifier is defective and the regulator/rectifier must be replaced.

**NOTE**

- The actual meter reading varies with the meter used and the individual rectifier, but, generally speaking the lower reading should be from zero to one half the scale.
16-30 ELECTRICAL SYSTEM

Charging System

Regulator Circuit Check
To test the regulator out of circuit, use three 12 V batteries
and a test light (12 V 3 – 6 W bulb in a socket with leads).

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>The test light works as an indicator and also a current limiter to protect the regulator/rectifier from excessive current. Do not use an ammeter instead of a test light.</td>
</tr>
</tbody>
</table>

- Check to be sure the rectifier circuit is normal before continuing.

- Do the 1st step regulator circuit test.
  - Connect the test light and the 12 V battery to the regulator/rectifier as shown.
  - Check the BK1, BK2 and BK3 terminal respectively.
  - If the test light turns on, the regulator/rectifier is defective. Replace it.
  - If the test light does not turn on, continue the test.

- Do the 2nd step regulator circuit test.
  - Connect the test light and the 12 V battery in the same manner as specified in the “Regulator Circuit Test-1st Step”.
  - Apply 12 V to the voltage BR terminal.
  - Check the BK1, BK2 and BK3 terminal respectively.
  - If the test light turns on, the regulator/rectifier is defective. Replace it.
  - If the test light does not turn on, continue the test.

- Do the 3rd step regulator circuit test.
  - Connect the test light and the 12 V battery in the same manner as specified in the “Regulator Circuit Test-1st Step”.
  - Momentarily apply 24 V to the voltage BR terminal by adding a 12 V battery.
  - Check the BK1, BK2 and BK3 terminals respectively.

<table>

<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not apply more than 24 V. If more than 24 V is applied, the regulator/rectifier may be damaged. Do not apply 24 V more than a few seconds. If 24 V is applied for more than a few seconds, the regulator/rectifier may be damaged.</td>
</tr>
</tbody>
</table>

- If the test light did not light when the 24 V was applied momentarily to the voltage monitoring terminal, the regulator/rectifier is defective. Replace it.
- If the regulator/rectifier passes all of the tests described, it may still be defective. If the charging system still does not work properly after checking all of the components and the battery, test the regulator/rectifier by replacing it with a known good unit.

Charging System

Charging Voltage Inspection

- Check the battery condition (see Charging Condition Inspection).
- Warm up the engine to obtain actual alternator operating conditions.
- Remove the seat (see Seat Removal in the Frame chapter).
- Check that the ignition switch is turned off, and connect the hand tester [A] to the battery terminals [B].

Special Tool - Hand Tester: 57001-1394

- Start the engine, and note the voltage readings at various engine speeds with the headlight turned on and then turned off (To turn off the headlight, disconnect the headlight connector on the headlight unit.). The readings should show nearly battery voltage when the engine speed is low, and, as the engine speed rises, the readings should also rise. But they must be kept under the specified voltage.

- Turn off the ignition switch to stop the engine, and disconnect the hand tester.

★ If the charging voltage is kept between the values given in the table, the charging system is considered to be working normally.
★ If the charging voltage is much higher than the values specified in the table, the regulator/rectifier is defective or the regulator/rectifier leads are loose or open.
★ If the charging voltage does not rise as the engine speed increases, then the regulator/rectifier is defective or the alternator output is insufficient for the loads. Check the alternator and regulator/rectifier to determine which part is defective.

**WARNING**

The ignition system produces extremely high voltage. Do not touch the spark plugs or stick coils while the engine is running, or you could receive a severe electrical shock.

**CAUTION**

Do not disconnect the battery cables or any other electrical connections when the ignition switch is on, or while the engine is running. This is to prevent ECU (Electric Control Unit) damage. Do not install the battery backwards. The negative side is grounded. This is to prevent damage to the ECU.

  - Clutch Cover (see Clutch Cover Removal in the Clutch chapter)

- Remove:
  - Bolts [A]
  - Crankshaft Sensor [B]
  - Pull out the grommet [C].
Ignition System

Crankshaft Sensor Installation
- Route the crankshaft sensor lead correctly (see Cable, Wire, and Hose Routing section in the Appendix chapter).
- Tighten:
  **Torque - Crankshaft Sensor Bolts:** 6.0 N·m (0.60 kgf·m, 53 in·lb)
- Apply silicone sealant [A] to the crankshaft sensor lead grommet.
  **Sealant - Kawasaki Bond (Silicone Sealant):** 92104-0004

Crankshaft Sensor Inspection
- Remove:
  - Right Frame Cover (see Frame Cover Removal in the Frame chapter)
  - Crankshaft Sensor Lead Connector [A]
- Set the hand tester to the × 100 Ω range and connect (+) lead to the black lead and (–) lead to the yellow lead in the connector.
  **Special Tool - Hand Tester:** 57001-1394
- If there is more resistance than the specified value, the coil has an open lead and must be replaced. Much less than this resistance means the coil is shorted, and must be replaced.
  **Crankshaft Sensor Resistance:** 376 – 564 Ω
- Using the highest resistance range of the tester, measure the resistance between the crankshaft sensor leads and chassis ground.
- Any tester reading less than infinity (∞) indicates a short, necessitating replacement of the crankshaft sensor assembly.

Crankshaft Sensor Peak Voltage Inspection

**NOTE**
- Be sure the battery is fully charged.
- Using the peak voltage adapter [A] is a more reliable way to determine the condition of the crankshaft sensor than crankshaft sensor internal resistance measurements.

Water Temperature Sensor Inspection

- Remove the water temperature sensor (see Removal/Installation in the Fuel System (DFI) chapter).
- Suspend the sensor [A] in a container of coolant so that the temperature-sensing projection [C] and threaded portion [C] are submerged.
- Suspend an accurate thermometer [B] with temperature-sensing projection located in almost the same depth.

**NOTE**

○ The sensor and thermometer must not touch the container side or bottom.

- Place the container over a source of heat and gradually raise the temperature of the coolant while stirring the coolant gently.
- Using the hand tester, measure the internal resistance of the sensor.
- If the hand tester does not show the specified values, replace the sensor.

  - Fuel Reserve Switch [D]

★ If the test light doesn’t light, replace the fuel pump.

**NOTE**
○ It may take a long time to turn on the test light in case that the fuel reserve switch is inspected just after the fuel pump is removed. Leave the fuel reserve switch with leads for inspection connected for few minutes.

- Remove:
  - Left Side Cover (see Side Cover Removal in the Frame chapter)
  - Cover (see Starter Relay Inspection)
  - Connector [A]
- Pull out the main fuse [B] from the starter relay with needle nose pliers.

Fuse Box Fuse Removal

15 A ECU Fuse Removal
- Remove:
  - Seat (see Seat Removal in the Frame chapter)
- Unlock the hook [A] to pull the lid [B].
- Pull out the ECU fuse [A] from the fuse box.
### Fuse

**Fuse Installation**
- If a fuse fails during operation, inspect the electrical system to determine the cause, and then replace it with a new fuse of proper amperage.
- Install the fuse box fuses on the original position as specified on the lid.

**Fuse Inspection**
- Remove the fuse (see 30 A Main/Fuse Box /15 A ECU Fuse Removal).
- Inspect the fuse element.
- If it is blown out, replace the fuse. Before replacing a blown fuse, always check the amperage in the affected circuit. If the amperage is equal to or greater than the fuse rating, check the wiring and related components for a short circuit.

#### CAUTION

When replacing a fuse, be sure the new fuse matches the specified fuse rating for that circuit. Installation of a fuse with a higher rating may cause damage to wiring and components.
